Technical Specification Group Services and System Aspects **TSGS#28(05)0252**
Meeting #28, Quebec, Canada
6-9 June 2005

**Source: TSG-SA WG4**

**Title: CRs TS 26.273 & TS 26.290 & TS 26.304 on Corrections to Extended AMR-WB+ codec specifications (Release 6)**

**Document for: Approval**

**Agenda Item: 7.4.3**

The following CRs, agreed at the TSG-SA WG4 meeting #35, are presented to TSG SA #28 for approval.

| Spec | CR | Rev | Phase | Subject | Cat | Vers | WG | Meeting | S4 doc |
|---|---|---|---|---|---|---|---|---|---|
| 26.273 | 001 | | Rel-6 | Prevent an access outside a buffer when simulating frame erasures | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050277 |
| 26.273 | 002 | 1 | Rel-6 | Remove unused code | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050417 |
| 26.273 | 003 | | Rel-6 | Remove IF2 header in AMR-WB bitstream | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050279 |
| 26.273 | 004 | | Rel-6 | Prevent an access outside a buffer in Reconst_spect function | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050280 |
| 26.273 | 005 | | Rel-6 | Decoder synchronization after frame erasures | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050281 |
| 26.273 | 006 | | Rel-6 | Correction of mode switching using configuration file | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050294 |
| 26.273 | 007 | | Rel-6 | Prevent encoding end of wave file information | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050295 |
| 26.273 | 008 | | Rel-6 | Correction of library function for 3GP file format | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050314 |
| 26.273 | 009 | | Rel-6 | Support for input files with sampling frequency other than 48 kHz | F | 6.0.0 | S4 | TSG-SA WG4#35 | S4-050416 |
| 26.290 | 006 | | Rel-6 | Correction of a value in Table 21 | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050286 |
| 26.304 | 026 | | Rel-6 | Correction of DTX handling in AMR-WB modes | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050274 |
| 26.304 | 027 | | Rel-6 | Remove IF2 header in AMR-WB bitstream | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050275 |
| 26.304 | 028 | | Rel-6 | Decoder synchronization after frame erasures | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050276 |
| 26.304 | 029 | | Rel-6 | Correction for buffer reading in low complexity encoder | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050284 |
| 26.304 | 030 | | Rel-6 | Correction to a wrong function call | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050291 |
| 26.304 | 031 | | Rel-6 | Correction of mode switching using configuration file | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050292 |
| 26.304 | 032 | | Rel-6 | Correction of information printed by decoder in DTX frames | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050293 |
| 26.304 | 033 | | Rel-6 | Correction of library function for 3GP file format | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050313 |
| 26.304 | 034 | | Rel-6 | Support for input files with sampling frequency other than 48 kHz | F | 6.2.0 | S4 | TSG-SA WG4#35 | S4-050415 |

| *Rel-5* | *(Release 5)* |
| *Rel-6* | *(Release 6)* |
| *Rel-7* | *(Release 7)* |

| | | |
|---|---|---|
| ***Reason for change:*** | ⌘ | To simulate a frame erasure, a file is parsed with the function *fscanf* with the parameter %d. The function *fscanf* with *%d* returns a integer (32bits). However, a *short* (16bits) is passed to receive what's found by *fscanf*. A temporary variable needs to be used with the call of fscanf and then put the result in the initial short array. |
| ***Summary of change:*** | ⌘ | Assure to use an integer instead of a short to receive the output of *fscanf*. |
| ***Consequences if not approved:*** | ⌘ | Access outside a buffer. |

**How to create CRs using this form:**
Comprehensive information and tips about how to create CRs can be found at http://www.3gpp.org/specs/CR.htm.
Below is a brief summary:

1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.

2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under ftp://ftp.3gpp.org/specs/ For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.

3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

# Changes to the C-code

## *1.* How the code is changed in the file *dec_wbplus_fx.c*

### Line 373

**Before the change:**

```
  Word32 old_bitrate;
```

**After the change:**

```
  Word32 old_bitrate, tmpbfi;
```

### Line 525-538

**Before the change:**

```
  if(conf.fer_sim)
    {
        if(conf.extension > 0)
         {
             for(i=0;i<4;i++)
             {
                fscanf(f_fer,"%d",&bfi[i]);
             }
         }
         else
         {
             fscanf(f_fer,"%d",&bfi[tfi]);
         }
    }
```

**After the change:**

```
if(conf.fer_sim)
    {

| | | |
|---|---|---|
| ***Reason for change:*** | ⌘ | There is possibility to access outside a buffer at the decoder when reconstructing the spectrum in a TCX lost frames. The spectrum reconstruction function needs to compute an arctangent, which is extrapolated from a table that contains piece-wise arctangent. The extrapolation is done differently depending on certain thresholds. One threshold was wrongly defined, which allowed an access outside a buffer. |
| ***Summary of change:*** | ⌘ | The problematic threshold was corrected. |
| ***Consequences if not approved:*** | ⌘ | May result in access outside a buffer in case of TXC lost frame concealment. |

**How to create CRs using this form:**
Comprehensive information and tips about how to create CRs can be found at http://www.3gpp.org/specs/CR.htm. Below is a brief summary:

1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.

2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under ftp://ftp.3gpp.org/specs/ For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.

3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

| | | |
|---|---|---|
| ***Reason for change:*** | ⌘ | The TCX seed is used in the random generator to create random noise injected in unquantized subbands. When a bad frame occurs, the decoder may choose a wrong decoding mode. For example, if the lost frame was a TCX frame and the last good frame was an ACELP, the decoder will perform concealment in the ACELP domain. In that case, the TCX seed will not be activated and the synchronization between the synthesis of concealed frame and a clean synthesis will be lost. This loss of synchronization doesn't affect the subjective quality of the synthesis but affects the indication of quality obtained by an objective tool like PEAQ. To solve the issue, we propose to generate the seed from bitstream parameters instead of keeping in memory the last value of the random generator. |
| ***Summary of change:*** | ⌘ | In the proposed change, a new seed is generated based on bitstream parameters instead of keeping in memory the last value of the random generator. The seed will be computed from parameters index and will be the same at both encoder and decoder. |
| ***Consequences if not approved:*** | ⌘ | Difficult to use objective tools in the comparison of quality of a synthesis containing lost frames to a clean reference synthesis. |

*R96* *(Release 1996)*
*R97* *(Release 1997)*
*R98* *(Release 1998)*
*R99* *(Release 1999)*
*Rel-4* *(Release 4)*
*Rel-5* *(Release 5)*
*Rel-6* *(Release 6)*
*Rel-7* *(Release 7)*

| | | |
|---|---|---|
| ***Reason for change:*** | ⌘ | The current version of the encoder does not support sampling frequencies other than 48, 16 and 8 kHz. Furthermore, sampling frequencies of 16 and 8 kHz are only supported in special modes. The objective of the modification is to make the encoder friendlier to use in removing the constraint on the sampling frequency usage. This will simplify the integration of the codec in platforms where sampling frequencies other than 48 kHz are supported. After the change, the supported sampling frequencies will be 8, 16, 24, 32, 48, 11.025, 22.5, and 44.1 kHz. |
| ***Summary of change:*** | ⌘ | The proposed change adds 1 filtering table and 1 conditional filtering operation at the encoder and at the decoder, to allow working at all sampling frequencies mentioned above. The encoder core works at certain internal sampling frequency (ISF); where a resampling filter performs down-sampling from 48 kHz to ISF KHz. With the suggested modification, the encoder input sampled at 8, 16, 24 or 32 kHz will be upsampled to 48 kHz and then down-sampled to ISF kHz (core working frequency). Alternatively, if the encoder input is sampled at 11.025 or 22.1 kHz, it will be up-sampled to 44.1 kHz and then down-sampled, with a new filter, to the core working frequency (ISF kHz). At the decoder, the synthesis will be first up-sampled to 48 or to 44.1 kHz (depending on the desired output sampling frequency) and then down-sampled to a sub-multiple if needed. Hence, the proposed change involves adding, both at the encoder and the decoder, a new, conditionnaly used, filtering table and a new, conditionnaly applied, filtering operation with its own filtering table. The proposed change does not affect the bitexactness for the previously supported sampling frequencies, and adds new supported input and output sampling frequencies. |

| | | |
|---|---|---|
| ***Consequences if not approved:*** | ⌘ | May be confusing to the users when they use input files with other sampling rates and get an error message.<br>Cumbersome offline sampling conversion will be needed before processing files with other sampling frequency and may result in bad performance if users do not perform these conversions properly. |

**How to create CRs using this form:**

Comprehensive information and tips about how to create CRs can be found at http://www.3gpp.org/specs/CR.htm. Below is a brief summary:

1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.

2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under ftp://ftp.3gpp.org/specs/ For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.

3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

# Changes to the C-code

## *1.* How the code is changed in the file options_*fx.h*

### Line 15

**Add these lines:**

```
/* AMR-WB+ input/output sampling rate filters */
/* Choice of filter should be selected according to the hardware specification
        */
/* Both can be selected if required */
/* FILTER_44khz allow 11025, 22050 and 44100 Hz sampling rates */
/* FILTER_48khz allow 8, 16, 24, 32 and 48 kHz sampling rates */
#define FILTER_44kHz
#define FILTER_48kHz
```

## *2.* How the code is changed in the file *decim_split_fx.c*

### Lines 19-25

**Code before change:**

```
Word16 Decim_split_12k8(  /* number of sample decimated */
  Word16 sig_fs[],        /* (i)  : signal to decimate  */
  Word16 sig12k8_lf[], /*(o)  : LF decimated signal */
  Word16 sig12k8_hf[],    /* (o)  : HF decimated signal */
  Word16 lg,              /* (i)  : length of LF and HF */
  Word16 fac_fs,          /* (i)  : at 48kHz, scale fac = fac_fs/FSCALE_DENOM */
  Word16 mem[],     /* (i/o): mem[L_MEM_DECIM_SPLIT] */
  Word16 *frac_mem  /* (i/o): interpol fraction memory */
)
```

**Code after change:**

```
Word16 Decim_split_12k8(  /* number of sample decimated */
  Word16 sig_fs[],        /* (i)  : signal to decimate  */
  Word16 lg_input,   /* input:  2*L_FRAME44k if 44kHz*/
  Word16 sig12k8_lf[], /*(o)  : LF decimated signal */

**How to create CRs using this form:**
Comprehensive information and tips about how to create CRs can be found at http://www.3gpp.org/specs/CR.htm. Below is a brief summary:

1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under ftp://ftp.3gpp.org/specs/ For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

## 8.1 Available Modes and Bitrates

The AMR-WB+ format contains the AMR-WB modes and a set of AMR-WB+ extension modes.
The AMR-WB+ codec includes the AMR-WB modes, as shown in Table 21 below.

**Table 21: AMR-WB+ modes.**

| Index | *Mode* | *Sampling rate (kHz)* | *Mono/Stereo* | *Number of data octets per frame (AMR-WB modes zero-padded)* |
|---|---|---|---|---|
| 0 | AMR-WB 6.60 kbit/s | 16 | Mono | 17 |
| 1 | AMR-WB 8.85 kbit/s | 16 | Mono | 23 |
| 2 | AMR-WB 12.65 kbit/s | 16 | Mono | 32 |
| 3 | AMR-WB 14.25 kbit/s | 16 | Mono | 36 |
| 4 | AMR-WB 15.85 kbit/s | 16 | Mono | 40 |
| 5 | AMR-WB 18.25 kbit/s | 16 | Mono | 46 |
| 6 | AMR-WB 19.85 kbit/s | 16 | Mono | 50 |
| 7 | AMR-WB 23.05 kbit/s | 16 | Mono | 58 |
| 8 | AMR-WB 23.85 kbit/s | 16 | Mono | 60 |
| 9 | AMR-WB SID | 16 | Mono | ~~6~~5 |
| 10 | AMR-WB+ 13.6 kbit/s | 16/24 | Mono | 34 |
| 11 | AMR-WB+ 18 kbit/s | 16/24 | Stereo | 45 |
| 12 | AMR-WB+ 24 kbit/s | 16/24 | Mono | 60 |
| 13 | AMR-WB+ 24 kbit/s | 16/24 | Stereo | 60 |
| 14 | FRAME_ERASURE | - | - | 0 |
| 15 | NO_DATA | - | - | 0 |

| | | |
|---|---|---|
| ***Reason for change:*** | ⌘ | The TCX seed is used in the random generator to create random noise injected in unquantized subbands. When a bad frame occurs, the decoder may choose a wrong decoding mode. For example, if the lost frame was a TCX frame and the last good frame was an ACELP, the decoder will perform concealment in the ACELP domain. In that case, the TCX seed will not be activated and the synchronization between the synthesis of concealed frame and a clean synthesis will be lost. This loss of synchronization doesn't affect the subjective quality of the synthesis but affects the indication of quality obtained by an objective tool like PEAQ. To solve the issue, we propose to generate the seed from bitstream parameters instead of keeping in memory the last value of the random generator. |
| ***Summary of change:*** | ⌘ | In the proposed change, a new seed is generated based on bitstream parameters instead of keeping in memory the last value of the random generator. The seed will be computed from parameters index and will be the same at both encoder and decoder. |
| ***Consequences if not approved:*** | ⌘ | Difficult to use objective tools in the comparison of quality of a synthesis containing lost frames to a clean reference synthesis. |

**How to create CRs using this form:**
Comprehensive information and tips about how to create CRs can be found at http://www.3gpp.org/specs/CR.htm. Below is a brief summary:

1) Fill out the above form. The symbols above marked ⌘ contain pop-up help information about the field that they are closest to.
2) Obtain the latest version for the release of the specification to which the change is proposed. Use the MS Word "revision marks" feature (also known as "track changes") when making the changes. All 3GPP specifications can be downloaded from the 3GPP server under ftp://ftp.3gpp.org/specs/ For the latest version, look for the directory name with the latest date e.g. 2001-03 contains the specifications resulting from the March 2001 TSG meetings.
3) With "track changes" disabled, paste the entire CR form (use CTRL-A to select it) into the specification just in front of the clause containing the first piece of changed text. Delete those parts of the specification which are not relevant to the change request.

| | | |
|---|---|---|
| ***Reason for change:*** | ⌘ | The current version of the encoder does not support sampling frequencies other than 48, 16 and 8 kHz. Furthermore, sampling frequencies of 16 and 8 kHz are only supported in special modes. The objective of the modification is to make the encoder friendlier to use in removing the constraint on the sampling frequency usage. This will simplify the integration of the codec in platforms where sampling frequencies other than 48 kHz are supported. After the change, the supported sampling frequencies will be 8, 16, 24, 32, 48, 11.025, 22.5, and 44.1 kHz. |
| ***Summary of change:*** | ⌘ | The proposed change adds 1 filtering table and 1 conditional filtering operation at the encoder and at the decoder, to allow working at all sampling frequencies mentioned above. The encoder core works at certain internal sampling frequency (ISF); where a resampling filter performs down-sampling from 48 kHz to ISF KHz. With the suggested modification, the encoder input sampled at 8, 16, 24 or 32 kHz will be upsampled to 48 kHz and then down-sampled to ISF kHz (core working frequency). Alternatively, if the encoder input is sampled at 11.025 or 22.1 kHz, it will be up-sampled to 44.1 kHz and then down-sampled, with a new filter, to the core working frequency (ISF kHz). At the decoder, the synthesis will be first up-sampled to 48 or to 44.1 kHz (depending on the desired output sampling frequency) and then down-sampled to a sub-multiple if needed. Hence, the proposed change involves adding, both at the encoder and the decoder, a new, conditionnaly used, filtering table and a new, conditionnaly applied, filtering operation with its own filtering table. The proposed change does not affect the bitexactness for the previously supported sampling frequencies, and adds new supported input and output sampling frequencies. |

| | | |
|---|---|---|
| ***Consequences if not approved:*** | ⌘ | May be confusing to the users when they use input files with other sampling rates and get an error message.<br>Cumbersome offline sampling conversion will be needed before processing files with other sampling frequency and may result in bad performance if users do not perform these conversions properly. |
