Title: $\quad$ CR 25.213-006: Update of downlink spreading sections

## Document for: Decision

This CR requests some changes to the description of downlink spreading in 25.213 , Section 5.1. It also requests some changes to the description of SCH codes in 25.213, Section 5.2.3.

The following changes are requested for Section 5.1

- Figure 8 shows the spreading operation for all downlink physical channels except the SCH , i.e. also for the P CCPCH. Based on the definition of P-CCPCH in 25.211, there seems to be no reason to have a specific description for the $\mathrm{P}-\mathrm{CCPCH}$ spreading.
- The illustration of multi-code transmission in Figure 8 is removed. Spreading in case of multi-code transmission is basically identical to spreading of multiple downlink channels in general, i.e. it does not need to be described explicitly.
- Multiplexing of SCH is no longer described as time multiplex with P-CCPCH. According to 25.211, SCH is defined for the entire slot, i.e. it is not really correct to state that the P-CCPCH and SCH are time multiplexed.
- The AICH description is moved to 25.211 , see related change request 25.211 CR XXX. The AICH generation deals with symbols, i.e. it does not belong to 25.213 which deals with spreading.

Changes are requested for Section 5.2.3 in order to clarify the following unclear areas:

- Connection between code number and row to use in the Hadamard matrix for generation of SSCs is incorrect, since not all rows are used in the Hadamard matrix.
- PSC and SSC is currently defined as real-valued codes that are later transmitted on both in-phase and quadrature branches. It is simpler to define the codes as being complex-valued from the beginning. This corresponds better with e.g. the PRACH/PCPCH preamble definitions.
- The mapping of $0 / 1$ to $+1 /-1$ is not very specific. It is proposed to describe the entire generation using the $+1 /-1$ notation.
- Different variables are defined not where they are needed, but randomly within the section, e.g. the sequence $b$ is used only for the generation of the SSC and should be described in connection with those codes and not the PSC.
- The use of the symbol $\mathrm{C}_{\text {sch,n }}$ is unnecessary and leads to confusion. Description can be done directly without this symbol, so it is proposed to delete it.
- The text in 5.2.3.2 does not explicitly state that it is the secondary SCH sequence that is found in Table5.
- It is not explained very clearly what is shown in Table 5.

## CHANGE REQUEST

25.213 CR 006

Please see embedded help file at the bottom of this page for instructions on how to fill in this form correctly.

Current Version: 3.0.0
for approval
 for information $\qquad$
strategic

Subject: Update of downlink spreading description

## Work item:

| Category: | F | Correction |
| :--- | :--- | :--- |
|  | A | Corresponds to a correction in an earlier release |
|  |  |  |
| (only one category | B | Addition of feature |
| shall be marked | C | Functional modification of feature |
| with an $X$ ) | D |  |

Release: Phase 2 Release 96
Release 97
Release 98
Release 99

Remove some inconsistencies between 25.213, Section 5.1 and 25.211.
Removal of time-multiplex of SCH and P-CCPCH
Correction to 25.213, Section 5.2.3:

- Connection between code number and row to use in the Hadamard matrix for generation of SSCs is incorrect, since not all rows are used in the Hadamard matrix.

Editorial enhancements:

- No specific description for P-CCPCH spreading
- No specific description for multi-code spreading
- $\quad$ AICH description moved to 25.211
- The PSC and SSC are now defined as complex-valued codes directly.

The mapping of $0 / 1$ to $+1 /-1$ is not very specific. It is proposed to describe the entire generation using the +1/-1 notation.

Different variables are defined not where they are needed, but randomly within the section, e.g. the sequence $b$ is used only for the generation of the SSC and should be described in connection with those codes and not the PSC.
The use of the symbol $\mathrm{C}_{\text {sch,n }}$ is unnecessary and leads to confusion. Description can be done directly without this symbol, so it is proposed to delete it.

- The text in 5.2.3.2 does not explicitly state that it is the secondary SCH sequence that is found in Table 5.
- It is not explained very clearly what is shown in Table 5.

Clauses affected: $\quad 3.2,5.1,5.2 .3 .1,5.2 .3 .2$

## Other <br> comments:

## 1 Scope

The present document describes spreading and modulation for UTRA Physical Layer FDD mode.

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply.

### 3.2 Symbols

For the purposes of the present document, the following symbols apply:

| $\mathrm{C}_{\mathrm{ch}, \mathrm{SF}, \mathrm{n}}$ : | n :th channelisation code with spreading factor SF |
| :---: | :---: |
| $\mathrm{C}_{\text {scramb }}$ : | scrambling code for uplink |
| $\mathrm{C}_{\text {siq, }, \text { s }}$ | RACH signature code. |
| $\mathrm{S}_{\mathrm{ul}, \mathrm{n}}$ : | UL scrambling code for desicated channels |
| $\mathrm{S}_{\mathrm{r}-\mathrm{pre}, \mathrm{n}}$ : | RACH preamble scrambling code |
| $\mathrm{S}_{\mathrm{r}-\mathrm{msg,n}}$ : | RACH message scrambling code |
| $\mathrm{S}_{\text {c-acc }}$ : | CPCH access preamble scrambling code |
| $\mathrm{S}_{\mathrm{c} \text {-cd }}$ : | CPCH CD preamble scrambling code |
| $\mathrm{S}_{\mathrm{c} \text {-msg,n}}$ : | CPCH message scrambling code |
| $\mathrm{S}_{\mathrm{dl}, \mathrm{n}}$ : | DL scrambling code |
| $\mathrm{C}_{\mathrm{psc}}$ : | PSC code |
| $\mathrm{C}_{\text {ssc,n }}$ : | n:th SSC code |

### 3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| AICH | Acquisition Indicator Channel |
| :--- | :--- |
| AP | Access Preamble |
| BCH | Broadcast Control Channel |
| CCPCH | Common Control Physical Channel |
| CD | Collision Detection |

| CPCH | Common Packet Channel |
| :--- | :--- |
| CPICH | Common Pilot Channel |
| DCH | Dedicated Channel |
| DPCH | Dedicated Physical Channel |
| DPCCH | Dedicated Physical Control Channel |
| DPDCH | Dedicated Physical Data Channel |
| FDD | Frequency Division Duplex |
| Mcps | Mega Chip Per Second |
| OVSF | Orthogonal Variable Spreading Factor (codes) |
| PDSCH | Physical Dedicated Shared Channel |
| PICH | Page Indication Channel |
| PRACH | Physical Random Access Channel |
| PSC | Primary Synchronisation Code |
| RACH | Random Access Channel |
| SCH | Synchronisation Channel |
| SSC | Secondary Synchronisation Code |
| SF | Spreading Factor |
| UE | User Equipment |

### 5.1 Spreading

Figure 8 illustrates the spreading operation for all downlink physical channels except SCH, i.e. for P-CCPCH, SCCPCH, CPICH, AICH, PICH, and downlink DPCH. The non-spread physical channel consists of a sequence of realvalued symbols. For all channels except AICH, the symbols can take the three values $+1,-1$, and 0 , where 0 indicates DTX. For AICH, the symbol values depend on the exact combination of acquisition indicators to be transmitted, compare [2] Section 5.3.3.6.

Each pair of two consecutive symbols is first serial-to-parallel converted and mapped to an I and Q branch. The mapping is such that even and odd numbered symbols are mapped to the I and Q branch respectively. For all channels except AICH, symbol number zero is defined as the first symbol in each frame. For AICH, symbol number zero is defined as the first symbol in each access slot. The I and Q branches are then spread to the chip rate by the same realvalued channelization code $\mathrm{C}_{\mathrm{ch}, \mathrm{SF}, \mathrm{m} .}$. The sequences of real-valued chips on the I and Q branch are then treated as a single complex-valued sequence of chips. This sequence of chips is scrambled (complex chip-wise multiplication) by a complex-valued scrambling code $\mathrm{S}_{\mathrm{dl}, \mathrm{n}}$. In case of P-CCPCH, the scrambling code is applied aligned with the P-CCPCH frame boundary, i.e. the first complex chip of the spread P-CCPCH frame is multiplied with chip number zero of the scrambling code. In case of other downlink channels, the scrambling code is applied aligned with the scrambling code applied to the $\mathrm{P}-\mathrm{CCPCH}$. In this case, the scrambling code is thus not necessarily applied aligned with the frame boundary of the physical channel to be scrambled.

Figure 8: Spreading for all downlink physical channels except SCH

Figure 9 illsutrates how different downlink channels are combined. Each complex-valued spread channel, corresponding to point $S$ in Figure 8, is separately weighted by a weight factor $\mathrm{G}_{\mathrm{i}}$. The complex-valued P-SCH and SSCH, as described in [1], section 5.3.3.4, are separately weighted by weight factors $G_{p}$ and $G_{s}$. All downlink physical channels are then combined using complex addition.

Figure 9: Spreading and modulation for SCH and P-CCPCH

### 5.2.3 Synchronisation codes

### 5.2.3.1 Code generation

The primary synchronisation code (PSC), $\mathrm{C}_{\mathrm{psc}}$ is constructed as a so-called generalised hierarchical Golay sequence. The PSC is furthermore chosen to have good aperiodic auto correlation properties.

Define

$$
a=\left\langle x_{1}, x_{2}, x_{3}, \ldots, x_{16}\right\rangle=\langle 1,1,1,1,1,1,-1,-1,1,-1,1,-1,1,-1,-1,1\rangle .
$$

The PSC is generated by repeating the sequence $a$ modulated by a Golay complementary sequence, and creating a complex-valued sequence with identical real and imaginary components. The PSC $\mathrm{C}_{\mathrm{psc}}$ is defined as

$$
\mathrm{C}_{\mathrm{psc}}=(1+j) \times\langle a, a, a,-a,-a, a,-a,-a, a, a, a,-a, a,-a, a, a\rangle
$$

where the leftmost chip in the sequence corresponds to the chip transmitted first in time
The 16 secondary synchronization codes ( SSCs ), $\left\{\mathrm{C}_{\mathrm{ssc}, 1}, \ldots, \mathrm{C}_{\mathrm{ssc}, 16}\right\}$, are complex-valued with identical real and imaginary components, and are constructed from position wise multiplication of a Hadamard sequence and a sequence $z$, defined as

$$
\begin{aligned}
& z=\langle b, b, b,-b, b, b,-b,-b, b,-b, b,-b,-b,-b,-b,-b\rangle, \text { where } \\
& b=\left\langle x_{1}, x_{2}, x_{3}, x_{4}, x_{5}, x_{6}, x_{7}, x_{8},-x_{9},-x_{10},-x_{11},-x_{12},-x_{13},-x_{14},-x_{15,},-x_{16}\right\rangle .
\end{aligned}
$$

The Hadamard sequences are obtained as the rows in a matrix $H_{8}$ constructed recursively by:

$$
\begin{gathered}
H_{0}=(1) \\
H_{k}=\left(\begin{array}{cc}
H_{k-1} & H_{k-1} \\
H_{k-1} & -H_{k-1}
\end{array}\right) \quad k \geq 1
\end{gathered}
$$

The rows are numbered from the top starting with row 0 (the all ones sequence).
Denote the $n$ :th Hadamard sequence as a row of $H_{8}$ numbered from the top, $\mathrm{n}=0,1,2, \ldots, 255, h_{n}$ in the sequel.Furthermore, let $h_{n}(i)$ and $z(i)$ denote the $i$ :th symbol of the sequences $h_{n}$ and $z$, respectively, where $i=0,1,2$, $\ldots, 255$ and $i=0$ corresponds to the leftmost symbol.

The $k$ :th $\mathrm{SSC}, \mathrm{C}_{\mathrm{ssc}, \mathrm{k}}, k=1,2,3, \ldots, 16$ is then defined as

$$
\mathrm{C}_{\mathrm{ssc}, \mathrm{k}}=(1+j) \times<h_{m}(0) \times z(0), h_{m}(1) \times z(1), h_{m}(2) \times z(2), \ldots, h_{m}(255) \times z(255)>
$$

where $m=16 \times(k-1)$ and the leftmost chip in the sequence corresponds to the chip transmitted first in time.

### 5.2.3.2 Code allocation of SSC

The 64 secondary SCH sequences are constructed such that their cyclic-shifts are unique, i.e., a non-zero cyclic shift less than 15 of any of the 64 sequences is not equivalent to some cyclic shift of any other of the 64 sequences. Also, a non-zero cyclic shift less than 15 of any of the sequences is not equivalent to itself with any other cyclic shift less than 15. Table 5 describes the sequences of SSCs used to encode the 64 different scrambling code groups. The entries in table 5 denote what SSC to use in the different slots for the different scrambling code groups, e.g. the entry " 7 " means that $\mathrm{SSC} \mathrm{C}_{\mathrm{ssc}, 7}$ shall be used for the corresponding scrambling code group and slot.

Table 5: Allocation of SSCs for secondary SCH.

| Scrambling Code Group | slot number |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \#0 | \#1 | \#2 | \#3 | \#4 | \#5 | \#6 | \#7 | \#8 | \#9 | \#10 | \#11 | \#12 | \#13 | \#14 |
| Group 1 | 1 | 1 | 2 | 8 | 9 | 10 | 15 | 8 | 10 | 16 | 2 | 7 | 15 | 7 | 16 |
| Group 2 | 1 | 1 | 5 | 16 | 7 | 3 | 14 | 16 | 3 | 10 | 5 | 12 | 14 | 12 | 10 |
