# 5.2.2.3 Timeslot formats

#### 5.2.2.3.1 Downlink timeslot formats

The downlink timeslot format depends on the spreading factor, midamble length and on the number of the TFCI bits, as depicted in the table 4a.

<u>Slot Format</u> <u>#</u>	Spreading Factor	Midamble length (chips)	<u>N<sub>TFCI</sub> (bits)</u>	<u>Bits/slot</u>	<u>N<sub>Data/Slot</sub> (bits)</u>	<u>N<sub>data/data field</sub></u> (bits)
<u>0</u>	<u>16</u>	<u>512</u>	<u>0</u>	<u>244</u>	<u>244</u>	<u>122</u>
<u>1</u>	<u>16</u>	<u>512</u>	<u>4</u>	<u>244</u>	<u>240</u>	<u>120</u>
2	<u>16</u>	<u>512</u>	<u>8</u>	<u>244</u>	<u>236</u>	<u>118</u>
<u>3</u>	<u>16</u>	<u>512</u>	<u>16</u>	<u>244</u>	<u>228</u>	<u>114</u>
<u>4</u>	<u>16</u>	<u>512</u>	<u>32</u>	<u>244</u>	<u>212</u>	<u>106</u>
<u>5</u>	<u>16</u>	<u>256</u>	<u>0</u>	<u>276</u>	<u>276</u>	<u>138</u>
<u>6</u>	<u>16</u>	<u>256</u>	<u>4</u>	<u>276</u>	<u>272</u>	<u>136</u>
<u>7</u>	<u>16</u>	<u>256</u>	<u>8</u>	<u>276</u>	<u>268</u>	<u>134</u>
<u>8</u>	<u>16</u>	<u>256</u>	<u>16</u>	<u>276</u>	<u>260</u>	<u>130</u>
<u>9</u>	<u>16</u>	<u>256</u>	<u>32</u>	<u>276</u>	<u>244</u>	<u>122</u>
<u>10</u>	<u>1</u>	<u>512</u>	<u>0</u>	<u>3904</u>	<u>3904</u>	<u>1952</u>
<u>11</u>	<u>1</u>	<u>512</u>	<u>4</u>	<u>3904</u>	<u>3900</u>	<u>1950</u>
<u>12</u>	<u>1</u>	<u>512</u>	<u>8</u>	<u>3904</u>	<u>3896</u>	<u>1948</u>
<u>13</u>	<u>1</u>	<u>512</u>	<u>16</u>	<u>3904</u>	<u>3888</u>	<u>1944</u>
<u>14</u>	<u>1</u>	<u>512</u>	<u>32</u>	<u>3904</u>	<u>3872</u>	<u>1936</u>
<u>15</u>	<u>1</u>	<u>256</u>	<u>0</u>	4416	4416	2208
<u>16</u>	<u>1</u>	<u>256</u>	<u>4</u>	4416	4412	2206
<u>17</u>	<u>1</u>	<u>256</u>	<u>8</u>	<u>4416</u>	4408	2204
<u>18</u>	<u>1</u>	<u>256</u>	<u>16</u>	4416	4400	2200
<u>19</u>	<u>1</u>	256	32	4416	4384	2192

#### Table 4a: Time slot formats for the Downlink

## 5.2.2.3.2 Uplink timeslot formats

The uplink timeslot format depends on the spreading factor, midamble length, the TPC presence and on the number of the TFCI bits. In the case that TPC is used, different amount of bits are mapped to the two data fields. The timeslot formats are depicted in the table 4b.

<u>Slot</u> <u>Format</u> <u>#</u>	Spreading Factor	<u>Midamble</u> <u>length</u> <u>(chips)</u>	<u>N<sub>TFCI</sub> (bits)</u>	<u>N<sub>TPC</sub></u> (bits)	Bits/slot	<u>N<sub>Data/Slot</sub></u> (bits)	<u>N<sub>data/data</sub></u> field(1) (bits)	<u>N<sub>data/data</sub></u> <u>field(2)</u> <u>(bits)</u>
<u>0</u>	<u>16</u>	<u>512</u>	<u>0</u>	<u>0</u>	<u>244</u>	<u>244</u>	<u>122</u>	<u>122</u>
<u>1</u>	<u>16</u>	<u>512</u>	<u>4</u>	<u>0</u>	<u>244</u>	<u>240</u>	<u>120</u>	<u>120</u>
2	<u>16</u>	<u>512</u>	<u>8</u>	<u>0</u>	<u>244</u>	<u>236</u>	<u>118</u>	<u>118</u>
<u>3</u>	<u>16</u>	<u>512</u>	<u>16</u>	<u>0</u>	<u>244</u>	<u>228</u>	<u>114</u>	<u>114</u>
<u>4</u>	<u>16</u>	<u>512</u>	<u>32</u>	<u>0</u>	<u>244</u>	<u>212</u>	<u>106</u>	<u>106</u>
<u>5</u>	<u>16</u>	<u>512</u>	<u>0</u>	<u>2</u>	<u>244</u>	<u>242</u>	<u>122</u>	<u>120</u>
<u>6</u>	<u>16</u>	<u>512</u>	<u>4</u>	<u>2</u>	<u>244</u>	<u>238</u>	<u>120</u>	<u>118</u>
<u>7</u>	<u>16</u>	<u>512</u>	<u>8</u>	<u>2</u>	<u>244</u>	<u>234</u>	<u>118</u>	<u>116</u>
<u>8</u>	<u>16</u>	<u>512</u>	<u>16</u>	<u>2</u>	<u>244</u>	<u>226</u>	<u>114</u>	<u>112</u>
<u>9</u>	<u>16</u>	<u>512</u>	<u>32</u>	<u>2</u>	<u>244</u>	<u>210</u>	<u>106</u>	<u>104</u>
<u>10</u>	<u>16</u>	<u>256</u>	<u>0</u>	<u>0</u>	<u>276</u>	<u>276</u>	<u>138</u>	<u>138</u>

# 5.2.3 Training sequences for spread bursts

As explained in the section 5.2.1, two options are being considered for the spreading. The training sequences presented here are common to both options.

The training sequences, i.e. midambles, of different users active in the same time slot are time shifted versions of one single periodic basic code. Different cells use different periodic basic codes, i.e. different midamble sets. In this way a joint channel estimation for the channel impulse responses of all active users within one time slot can be done by one single cyclic correlation. The different user specific channel impulse response estimates are obtained sequentially in time at the output of the correlator. Following this principle it is shown hereafter how to derive the midambles from the periodic basic code.

Section 5.2.2 contains a description of the spread speech/data bursts. These bursts contain Lm midamble chips, which are also termed midamble elements. The Lm elements  $\underline{m}_{i}^{(k)}$ ; i=1,...,Lm; k=1,...,K; of the midamble codes  $\underline{\mathbf{m}}^{(k)}$ ; k=1,...,K; are taken from the complex set

$$\underline{\mathbf{V}}_{\mathrm{m}} = \{\mathbf{1}, \mathbf{j}, -\mathbf{1}, -\mathbf{j}\}.\tag{1}$$

K is the maximum number of users, i.e. the available number of spreading codes per time slot.

The elements  $\underline{m}_{i}^{(k)}$  of the complex midamble codes  $\underline{\mathbf{m}}^{(k)}$  fulfil the relation

$$\underline{m}_{i}^{(k)} = (\mathbf{j})^{i} \cdot m_{i}^{(k)} \quad m_{i}^{(k)} \in \{1, -1\}; i = 1, \dots, L_{m}; k = 1, \dots, K.$$
(2)

Hence, the elements  $\underline{m}_{i}^{(k)}$  of the complex midamble codes  $\underline{\mathbf{m}}^{(k)}$  of the K users are alternating real and imaginary. With W being the number of taps of the impulse response of the mobile radio channels, the Lm binary elements  $m_{i}^{(k)}$ ;  $\mathbf{i} = 1, ..., L_{\mathbf{m}}$ ; k = 1, ..., K; of (2) for the complex midambles  $\underline{\mathbf{m}}^{(k)}$ ;  $\mathbf{k}=1,...,\mathbf{K}$ ; of the K users are generated according to the following method from a single periodic basic code

$$\mathbf{m} = \left(m_1, m_2, \dots, m_{L_m + (K'-1)W + \lfloor P/K \rfloor}\right)^{\mathrm{T}} m_i \in \{1, -1\}; \ i = 1, \dots, (L_m + (K'-1)W + \lfloor P/K \rfloor).$$
(3)

 $\lfloor x \rfloor$  denotes the largest integer smaller or equal to x, K' = K/2.

The elements  $m_i$ ;  $i = 1,...,(L_m + (K'-1)W + \lfloor P/K \rfloor)$ , of (3) fulfil the relation

$$m_i = m_{i-P}$$
 for the subset  $i = (P+1), ..., (L_m + (K'-1)W + \lfloor P/K \rfloor).$  (4)

The P elements  $m_i$ ; i = 1, ..., P, of one period of m according to (3) are contained in the vector

$$\mathbf{m}_{\mathrm{P}} = \left(m_1, m_2, \dots, m_P\right)^{\mathrm{T}}.$$
(5)

With **m** according to (3) the Lm binary elements  $m_i^{(k)}$ ;  $i = 1,...,L_m$ ; k = 1,...,K; of (2) for the midambles of the first K' users are generated based on the following formula

$$m_i^{(k)} = m_{i+(K-k)W} \quad i = 1, \dots, L_m; k = 1, \dots, K.$$
 (6)

The midambles for the second K' users are generated based on a slight modification of this formula introducing intermediate shifts

$$m_i^{(k)} = m_{i+(K'-k)W+\lfloor P/K \rfloor} \quad i = 1, \dots, L_m; k = K'+1, \dots, K.$$
(7)

Whether intermediate shifts are allowed in a cell is broadcast on the BCH.

In the following the term 'a midamble code set' or 'a midamble code family' denotes K specific midamble codes  $\underline{\mathbf{m}}^{(k)}$ ; k=1,...,K. Different midamble code sets  $\underline{\mathbf{m}}^{(k)}$ ; k=1,...,K; are specified based on different periods  $\mathbf{m}_{\rm P}$  according (5).

In adjacent cells of the cellular mobile radio system, different midamble codes sets  $\underline{\mathbf{m}}^{(k)}$ ; k=1,...,K; should be used to guarantee a proper channel estimation.

As mentioned above a single midamble code set  $\underline{\mathbf{m}}^{(k)}$ ; k=1,...,K; consisting of K midamble codes is based on a single period  $\mathbf{m}_{\rm P}$  according to (5).

In the Annex A the periods  $\mathbf{m}_{p}$  according to (5), i.e. the Basic Midamble Codes, which shall be used to generate different midamble code sets  $\mathbf{m}^{(k)}$ ; k=1,...,K; are listed in tables in a hexadecimal representation. As shown in table 54 always 4 binary elements  $m_{i}$  are mapped on a single hexadecimal digit.

4 binary elements $m_i$	Mapped on hexadecimal digit
-1 -1 -1 -1	0
-1 -1 -1 1	1
-1 -1 1 -1	2
-1 -1 1 1	3
-1 1 -1 -1	4
-1 1 -1 1	5
-1 1 1 -1	6
-1 1 1 1	7
1 -1 -1 -1	8
1 -1 -1 1	9
1 -1 1 -1	A
1 -1 1 1	В
1 1 -1 -1	С
1 1 -1 1	D
1 1 1 –1	E
1 1 1 1	F

Table <u>5</u>4: Mapping of 4 binary elements  $m_i$  on a single hexadecimal digits

As different Basic Midamble Codes are required for different burst formats, the Annex A shows the codes  $m_{PL}$  for burst type 1 and  $m_{PS}$  for burst type 2. It should be noted that the different burst types must not be mixed in the same timeslot of one cell.

## 5.2.3.1 Midamble Transmit Power

If in the downlink all users in one time slot have a common midamble, the transmit power of this common midamble is such that there is no power offset between the data part and the midamble part of the transmit signal within the time slot.

In the case of user specific midambles, the transmit power of the user specific midamble is such that there is no power offset between the data parts and the midamble part for this user within one slot.

# 5.2.4 Beamforming and Transmit Diversity

When DL beamforming or TX Diversity is used, at least that user to which beamforming/Tx Diversity is applied and which has a dedicated channel shall get one individual midamble according to chapter 5.2.3, even in DL.

# 5.3 Common control physical channels (CCPCH)

# 5.3.1 Downlink common control physical channel

Either the BCH, the PCH or the FACH as described in section 4.1.2 are mapped onto one or more downlink common control physical channels (CCPCH). In such a way the capacity of BCH, PCH and FACH can be adopted depending on the operators need.

#### 5.3.1.1 Spreading codes

The downlink CCPCH uses fixed spreading with a spreading factor SF = 16 as described in section 5.2.1.1.

20

## 5.3.1.2 Burst Types

The burst type 1 as described in section 5.2.2 is used for the downlink CCPCH. No TFCI is applied for CCPCHs.

#### 5.3.1.3 Training sequences for spread bursts

The training sequences, i.e. midambles, as described in section 5.2.3 are used for the downlink CCPCH.

## 5.3.1.4 Primary Common Control Physical Channels (PCCPCH)

A CCPCH is referred to as Primary Common Control Physical Channel (PCCPCH) if it is characterised by:

- Transmitted with reference power
- No beamforming
- Known position (timeslot, burst format and code) in frame. The position is known from the Synchronisation Channel (SCH), see section 5.4.
- Carrying BCH

If another physical channel is allocated to the same channelisation code and same timeslot as a PCCPCH, i.e. the same physical resource is used in a multiframe pattern, then this channel has also to use reference power and no beamforming can be applied.

# 5.3.2 The physical random access channel (PRACH)

The RACH or in case of ODMA networks the ORACH as described in section 4.1.2 are mapped onto one or more uplink physical random access channels (PRACH). In such a way the capacity of RACH and ORACH can be flexibly scaled depending on the operators need.

This description of the physical properties of the PRACH also applies to bursts carrying other signaling or user traffic if they are scheduled on a time slot which is (partly) allocated to the RACH or ORACH.

#### 5.3.2.1 PRACH Spreading codes

The uplink PRACH uses either spreading factor SF=16 or SF=8 as described in section 5.2.1.1. The set of admissible spreading codes for use on the PRACH and the associated spreading factors are broadcast on the BCH (within the RACH configuration parameters on the BCH).

# 5.3.2.2 PRACH Burst Types

The mobile stations send the uplink access bursts randomly in the PRACH. The PRACH burst consists of two data symbol fields, a midamble and a guard period. The second data symbol field is shorter than the first symbol data field by 96 chips in order to provide additional guard time at the end of the PRACH time slot.

The precise number of collision groups depends on the spreading codes (i.e. the selected RACH configuration. The access burst is depicted in figure 10, the contents of the access burst fields are listed in table  $\frac{87}{28}$ .

Data symbols 976 chips	Midamble 512 chips	Data symbols 880 chips	GP 192 CP
4	2560*T <sub>c</sub>		<b></b>

#### Figure 12: PRACH burst, GP denotes the guard period

#### Table 87: number of symbols per data field in PRACH burst

Spreading factor (Q)	Number of symbols in data field 1	Number of symbols in data field 2
8	122	110
16	61	55

~4
11
~ .

Chip number (CN)	Length of field in chips	Length of field in symbols	Contents of field
0-975	976	cf table 1	Data symbols
976-1487	512	-	Midamble
1488-2367	880	cf table 1	Data symbols
2368-2559	192	-	Guard period

#### Table <u>98</u>: The contents of the PRACH burst field

## 5.3.2.3 PRACH Training sequences

The training sequences, i.e. midambles, of different users active in the same time slot are time shifted versions of a single periodic basic code. The basic midamble codes used for PRACH bursts are the same as for burst type 1 and are shown in Annex A. The necessary time shifts are obtained by choosing either *all* k=1,2,3...,K' (for cells with small radius) or *uneven*  $k=1,3,5,...\leq K'$  (for cells with large radius). Different cells use different periodic basic codes, i.e. different midamble sets.

For cells with large radius additional midambles may be derived from the time-inverted Basic Midamble Sequence. Thus, the second Basic Midamble Code  $m_2$  is the time inverted version of Basic Midamble Code  $m_1$ .

In this way, a joint channel estimation for the channel impulse responses of all active users within one time slot can be performed by a maximum of two cyclic correlations (in cells with small radius, a single cyclic correlator suffices). The different user specific channel impulse response estimates are obtained sequentially in time at the output of the cyclic correlators.

# 5.3.2.4 Association between Training Sequences and Spreading Codes

For the PRACH there exists a fixed association between the training sequence and the spreading code. The generic rule to define this association is based on the order of the spreading codes  $\mathbf{a}_Q^{(k)}$  given by *k* and the order of the midambles  $\mathbf{m}_j^{(k)}$  given by *k*, firstly, and *j*, secondly, with the constraint that the midamble for a spreading factor *Q* is the same as in the upper branch for the spreading factor 2*Q*. The index *j*=1 or 2 indicates whether the original Basic Midamble Sequence (j=1) or the time-inverted Basic Midamble Sequence is used (j=2).

- For the case that all *k* are allowed and only one periodic basic code m<sub>1</sub> is available for the RACH, the association depicted in figure 13 is straightforward.
- For the case that only odd *k* are allowed the principle of the association is shown in figure 14. This association is applied for one and two basic periodic codes.

Figure 13: Association of Midambles to Spreading Codes in the OVSF tree for all *k* 

Figure 14: Association of Midambles to Spreading Codes in the OVSF tree for odd k

# 5.4 The physical synchronisation channel (PSCH)

In TDD mode code group of a cell can be derived from the synchronisation channel. Additional information, received from higher layers on SCH transport channel, is also transmitted to the UE in PSCH in case 3 from below. In order not to limit the uplink/downlink asymmetry the PSCH is mapped on one or two downlink slots per frame only.

There are three cases of PSCH and PCCPCH allocation as follows:

- Case 1) PSCH and PCCPCH allocated in TS#k, k=0....14
- Case 2) PSCH in two TS and PCCPCH in the same two TS: TS#k and TS#k+8, k=0...6
- Case 3) PSCH in two TS, TS#k and TS#k+8, k=0...6, and the PCCPCH in TS#i, i=0...14, pointed by PSCH. Pointing is determined via the SCH from the higher layers.

These three cases are addressed by higher layers using the SCCH in TDD Mode. The position of PSCH (value of k) in frame can change on a long term basis in any case.

Due to this PSCH scheme, the position of PCCPCH is known from the PSCH. The PCCPCH are using burst type 1, spreading code  $a_{Q=16}^{(k=1)}$  and midamble  $m_1^{(1)}$ . To simplify measurements of PCCPCH power, this midamble shall not be used by other physical channels in the same timeslot.

Figure 15 is an example for transmission of PSCH, k=0, of Case 2 or Case 3.

# Figure 15: Scheme for Physical Synchronisation channel PSCH consisting of one primary sequence $C_p$ and N=3 parallel secondary sequences in slot k and k+8

(example for k=0 in Case 2 or Case 3)

As depicted in figure 15, the PSCH consists of a primary and three secondary code sequences with 256 chips length. The primary and secondary code sequences are defined in TS 25.223 chapter 7 'Synchronisation codes'. The secondary codes are transmitted either in the I channel or the Q channel, depending on the code group.

Due to mobile to mobile interference, it is mandatory for public TDD systems to keep synchronisation between base stations. As a consequence of this, a capture effect concerning PSCH can arise. The time offset  $t_{offset}$  enables the system to overcome the capture effect.

The time offset  $t_{offset}$  is one of 32 values, depending on the cell parameter, thus on the code group of the cell, cf. 'table 7 Mapping scheme for Cell Parameters, Code Groups, Scrambling Codes, Midambles and  $t_{offset}$ ' in [8]. The exact value for  $t_{offset}$ , regarding column 'Associated  $t_{offset}$ ' in table 7 from in [8] is given by:

$$t_{offset,n} = n \cdot T_c \left[ \frac{2560 - 96 - 256}{31} \right]$$
  
=  $n \cdot 71T_c$ ;  $n = 0, ..., 31$ 

Please note that |x| denotes the largest integer number less or equal to x and that T<sub>c</sub> denotes the chip duration.
