3GPP T3 (USIM) Meeting #17
Berlin, Germany, 15 - 17 January, 2001

Tdoc T3-010058

LIAISON STATEMENT

Minimum clock frequency indication

From: T3

To: S3

Contact: Rune Lindholm (rune.lindholm@nokia.com)

T3 has defined the minimum clock frequency to be used by the terminal during the USIM session. The purpose of this parameter is to ensure that time critical commands like the AUTHENTICATE command are executed within the required time.

T3 has noted that a value of 3.25 MHz has been used in S3 documents (33.105) when setting the requirements for the sample authentication algorithm. S3 is asked to note that the original value of 3.25MHz had been derived from the GSM inherent frequency of 13MHz, and was therefore considered to be an indication only.

T3 would like to inform S3 that T3 has recently specified the minimum clock frequency to be 3MHz and is asking S3 to update the affected documents accordingly.
