

CC Interception for IMS-based VoIP Calls

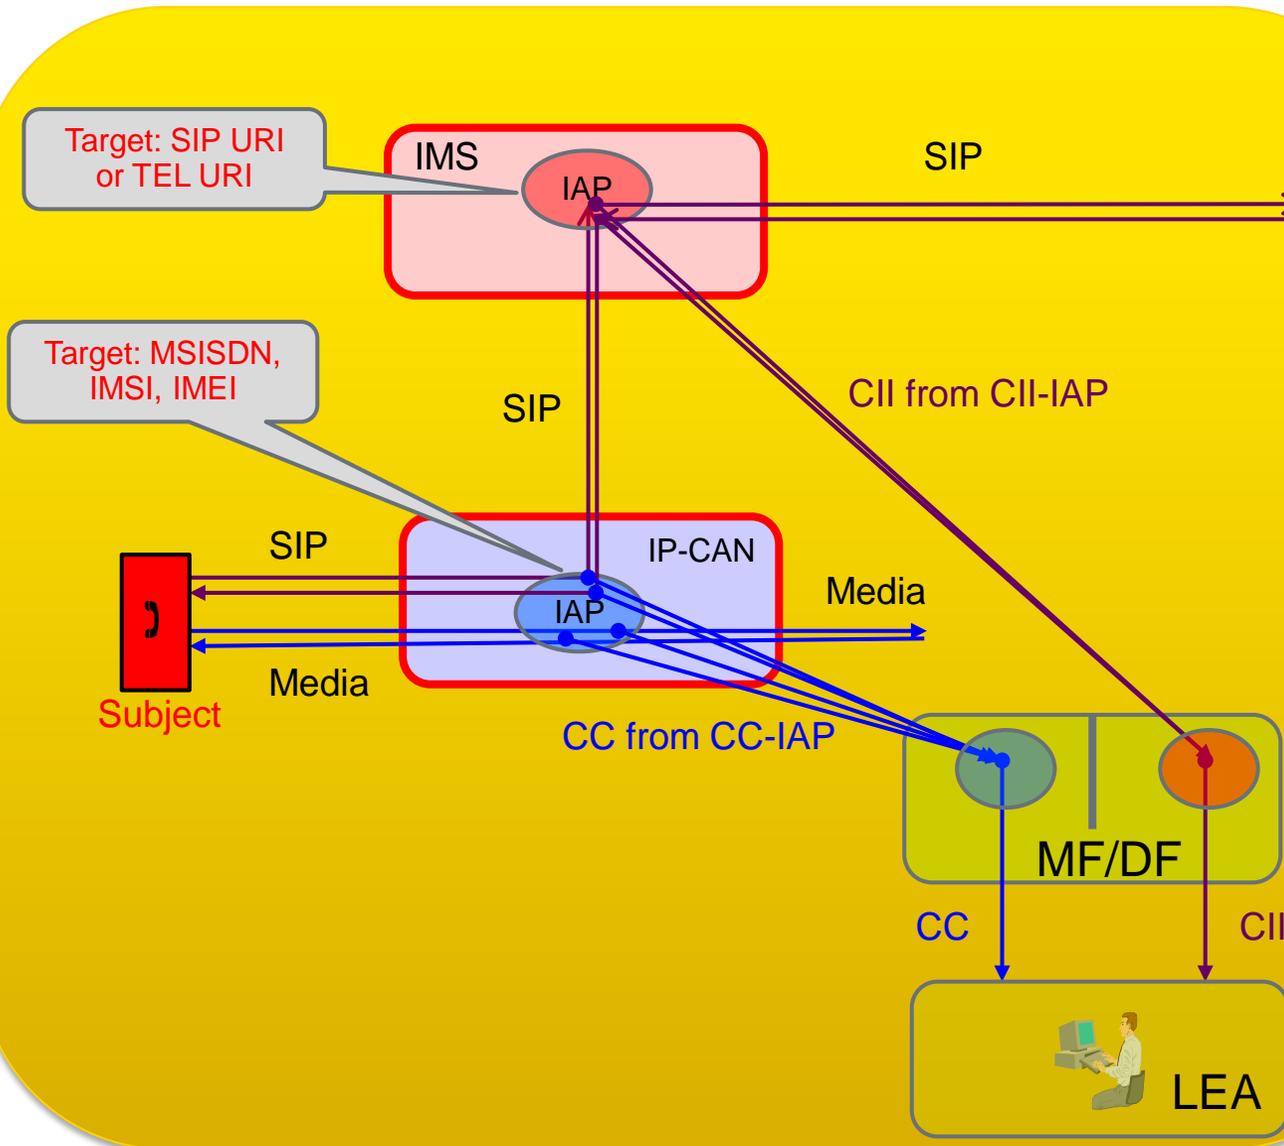

Nagaraja (Nag) Rao

nagaraja.rao@nsn.com, Tel: +1 561 306 5062

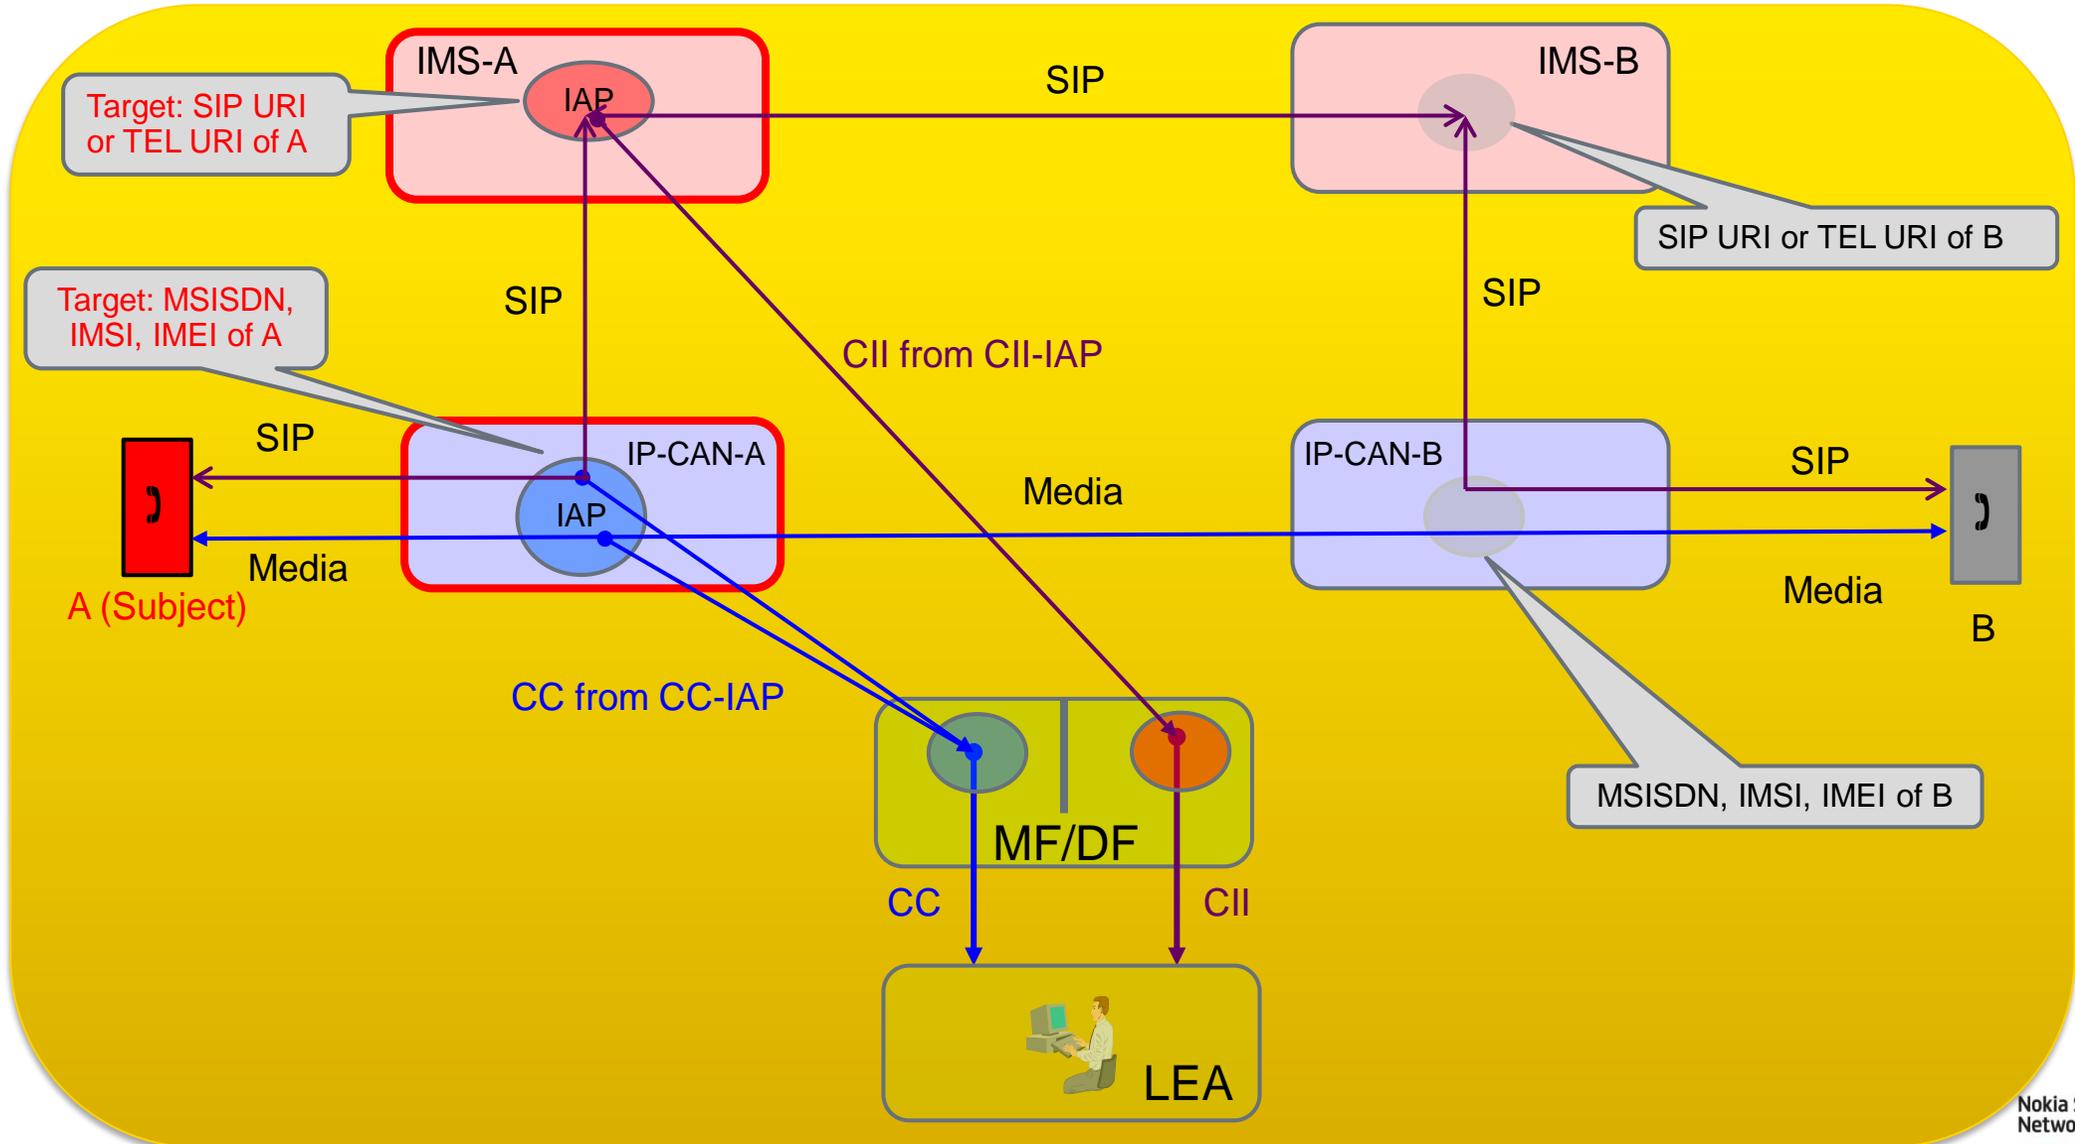

Problem Overview

Problem Summary

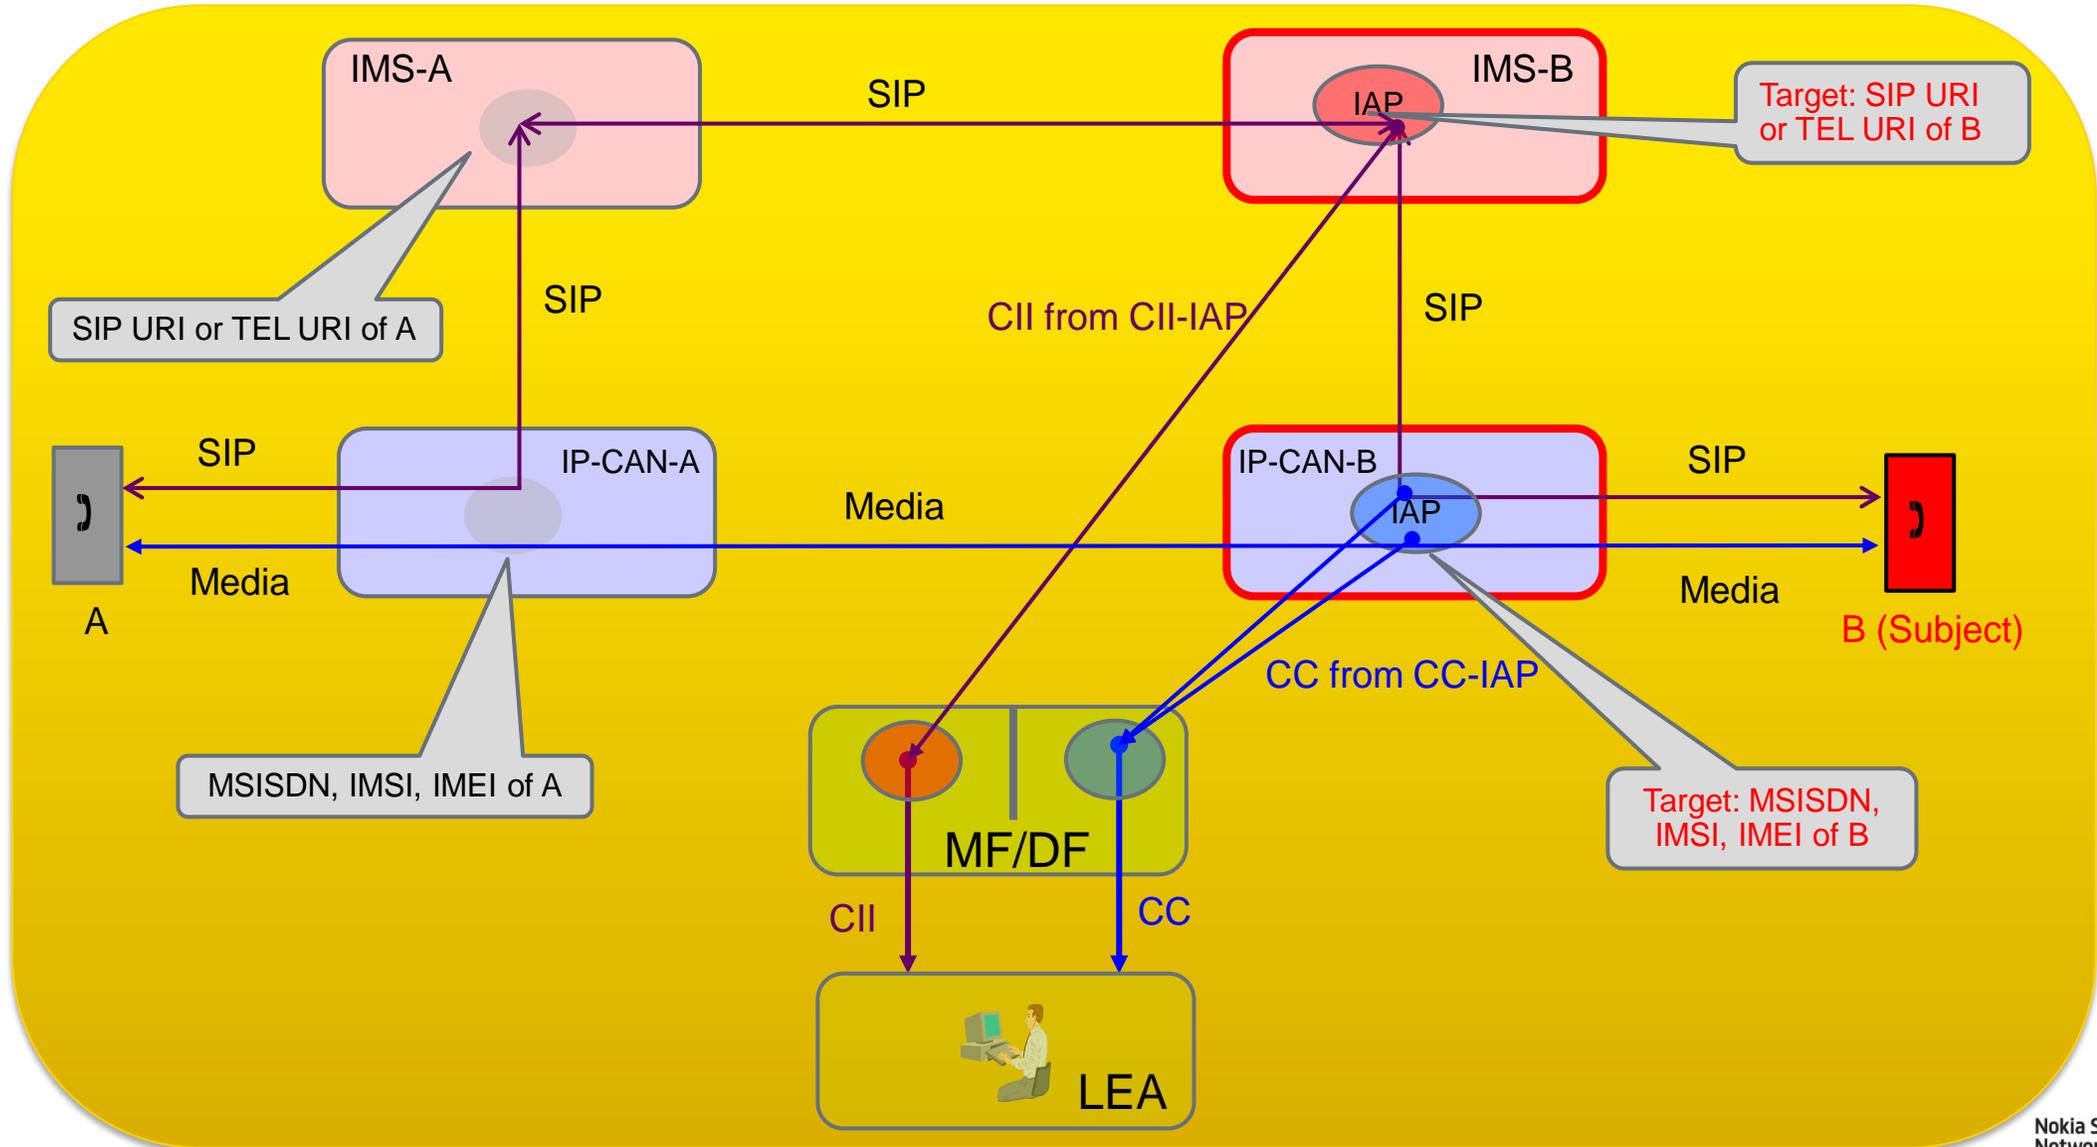

- ATIS Standards focus on “e” interface & indicate that the CC interception can be done at IP-CAN and may be at MGW (for PSTN forwarding scenarios);
- 3GPP Standards assume Packet Data Interception for CC;
- Issues:
 - Two separate Subject Identifiers
 - IAPs statically provisioned;
 - All packets are intercepted as CC - including signaling and other packet data traffic, no correlation to the actual voice call;
 - Correlation of CC with CII
 - CC interception for forwarded calls;
 - Generation of CC-related events;
 - Extraction of DTMF digits from Subject voice-stream.

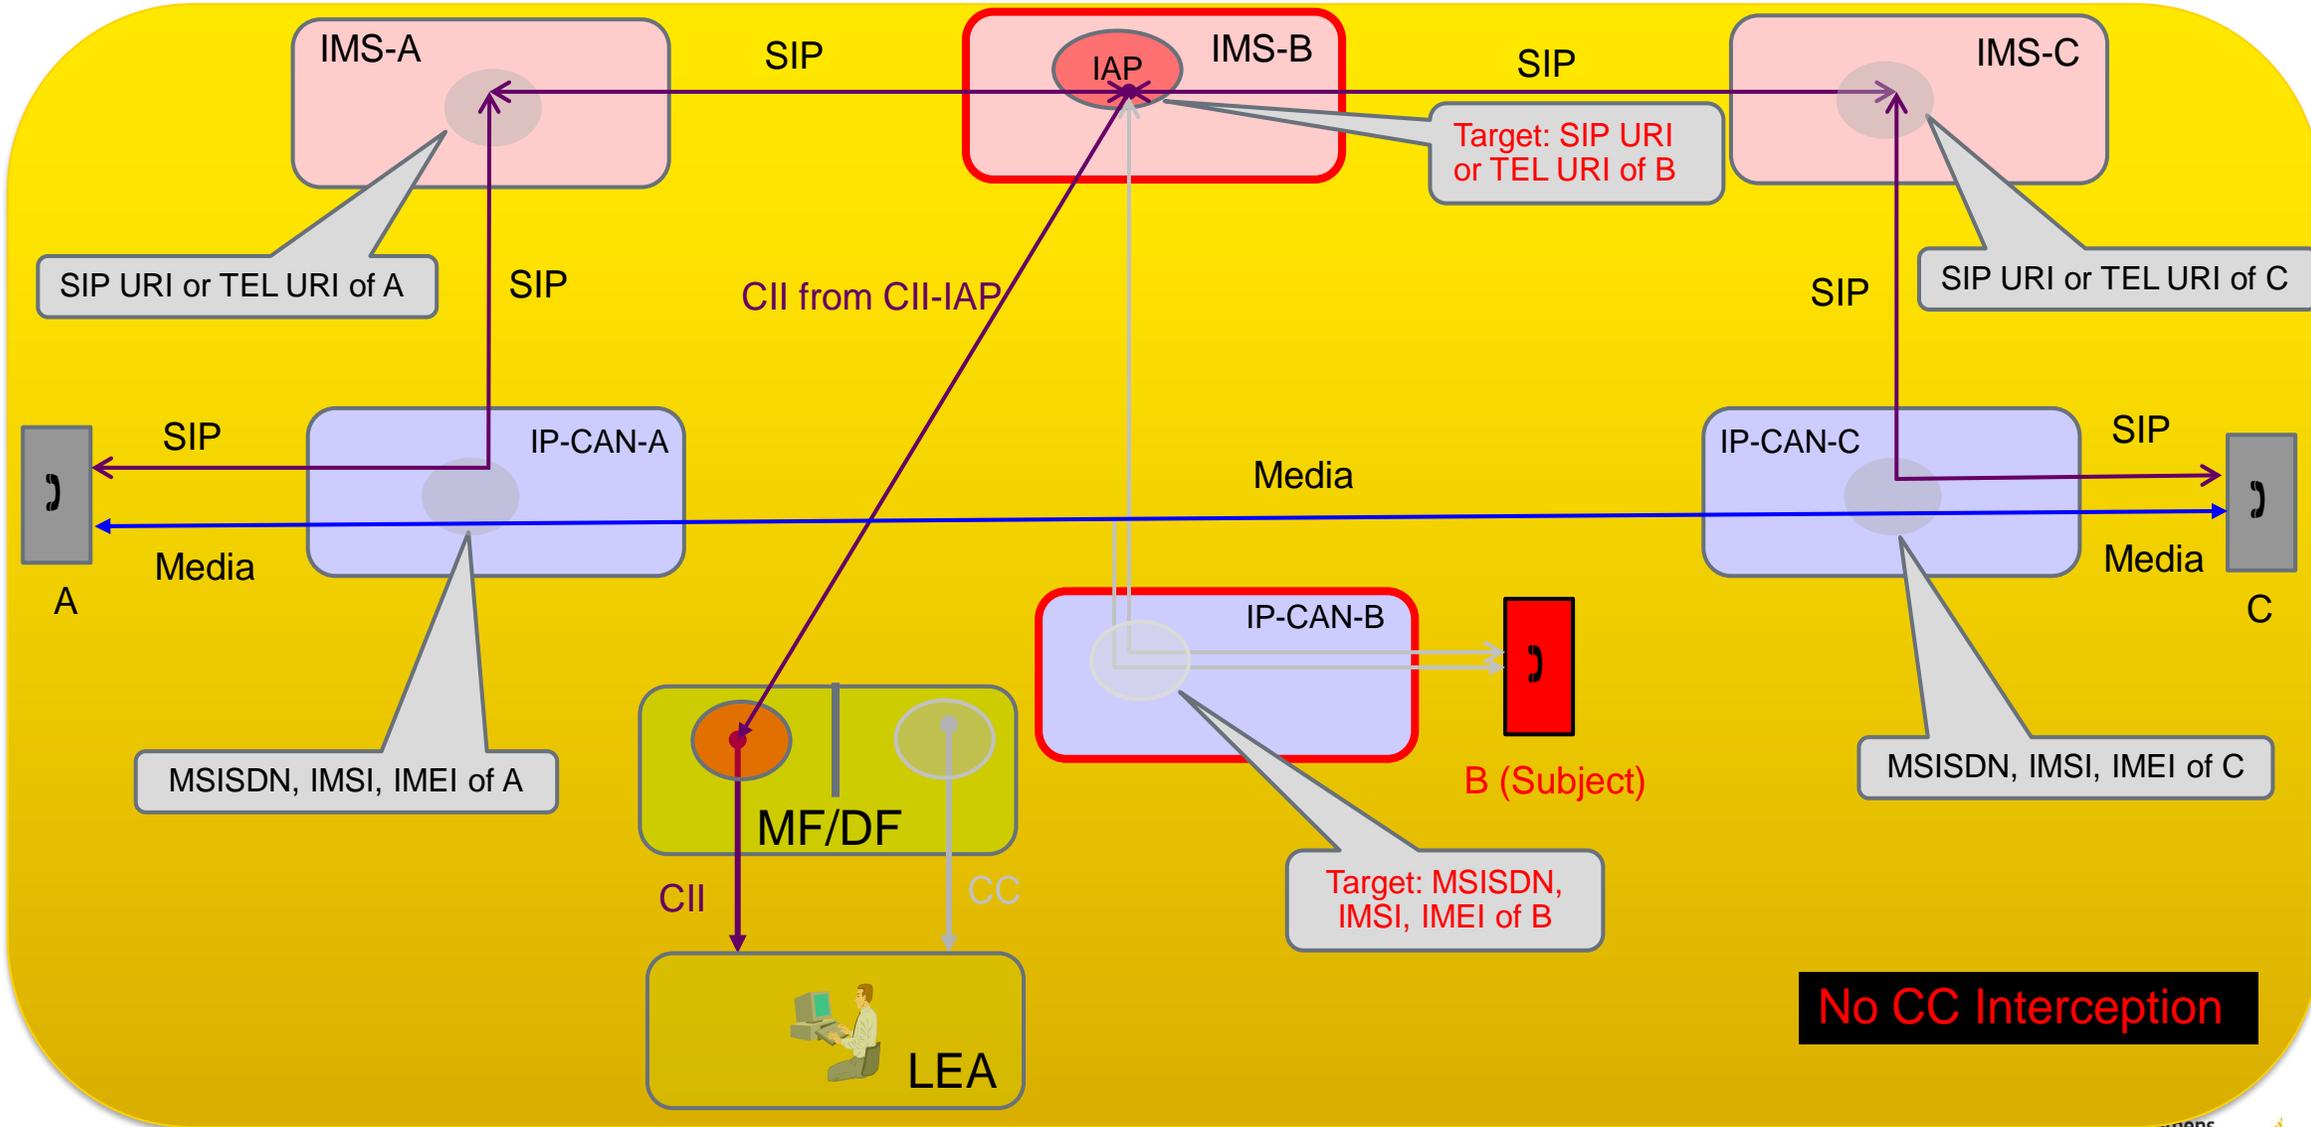

Problem Case 1: A-party is the Subject; Originating Call

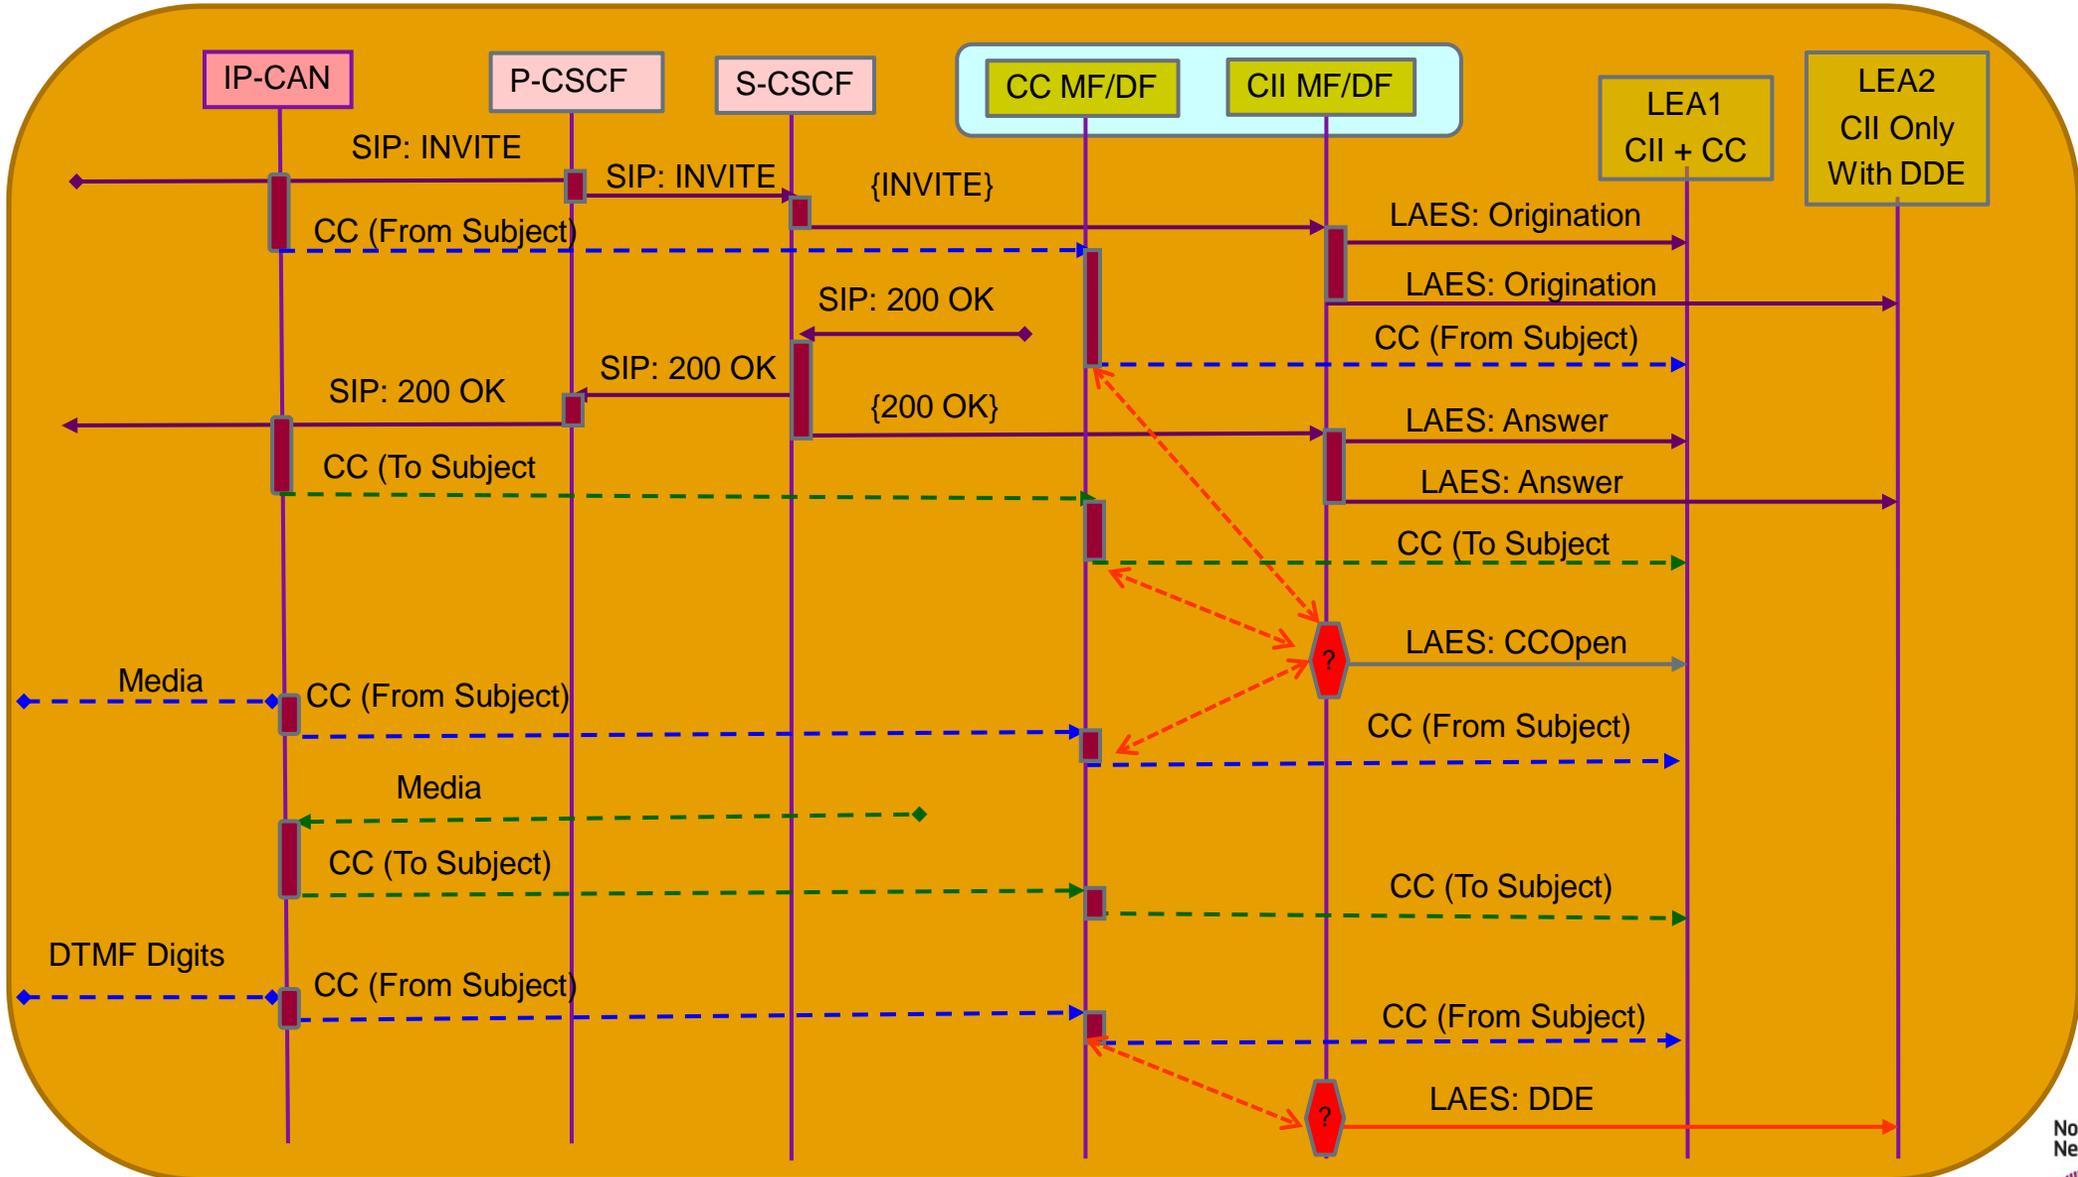

Problem Case 2: B-party is the Subject; Terminating Call

Problem Case 3: B-party is the Subject; Call Forwarding

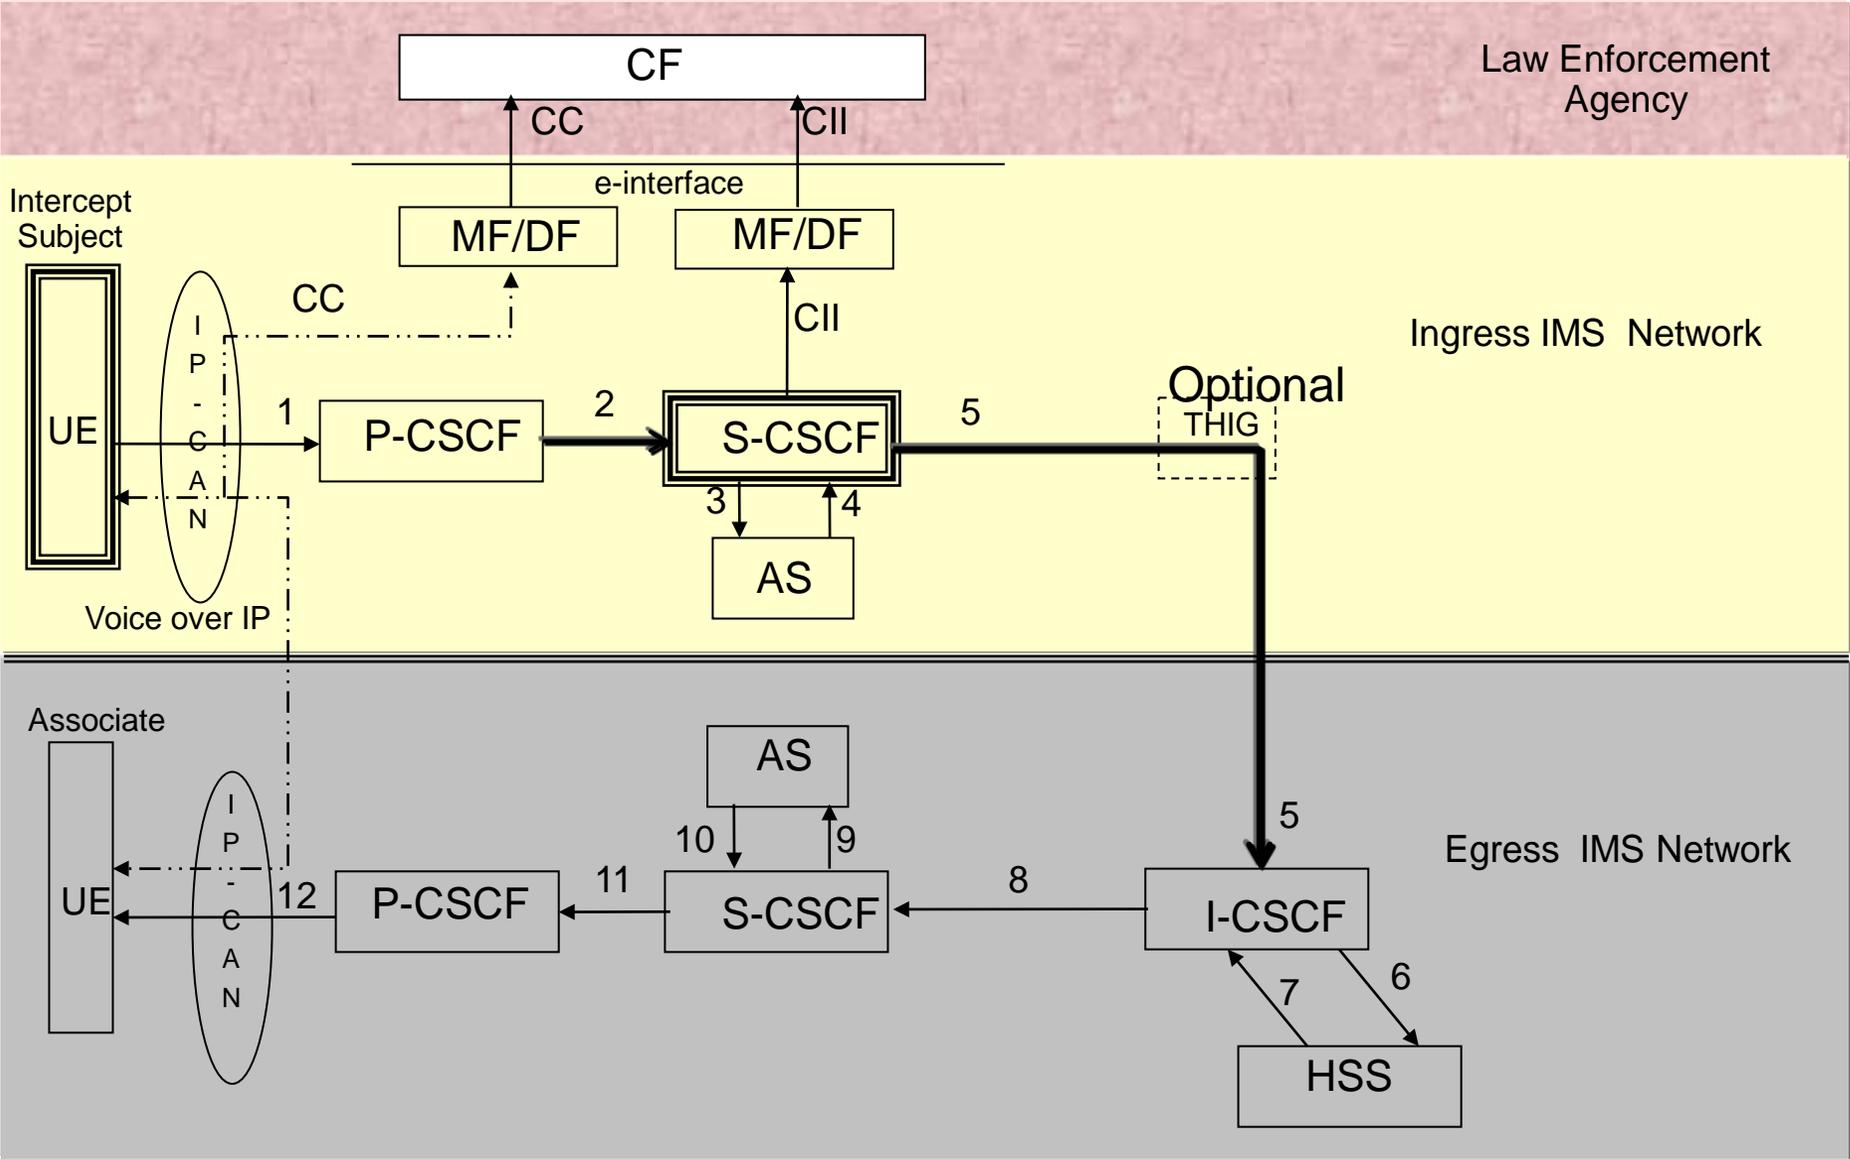

A Sample Call Flow

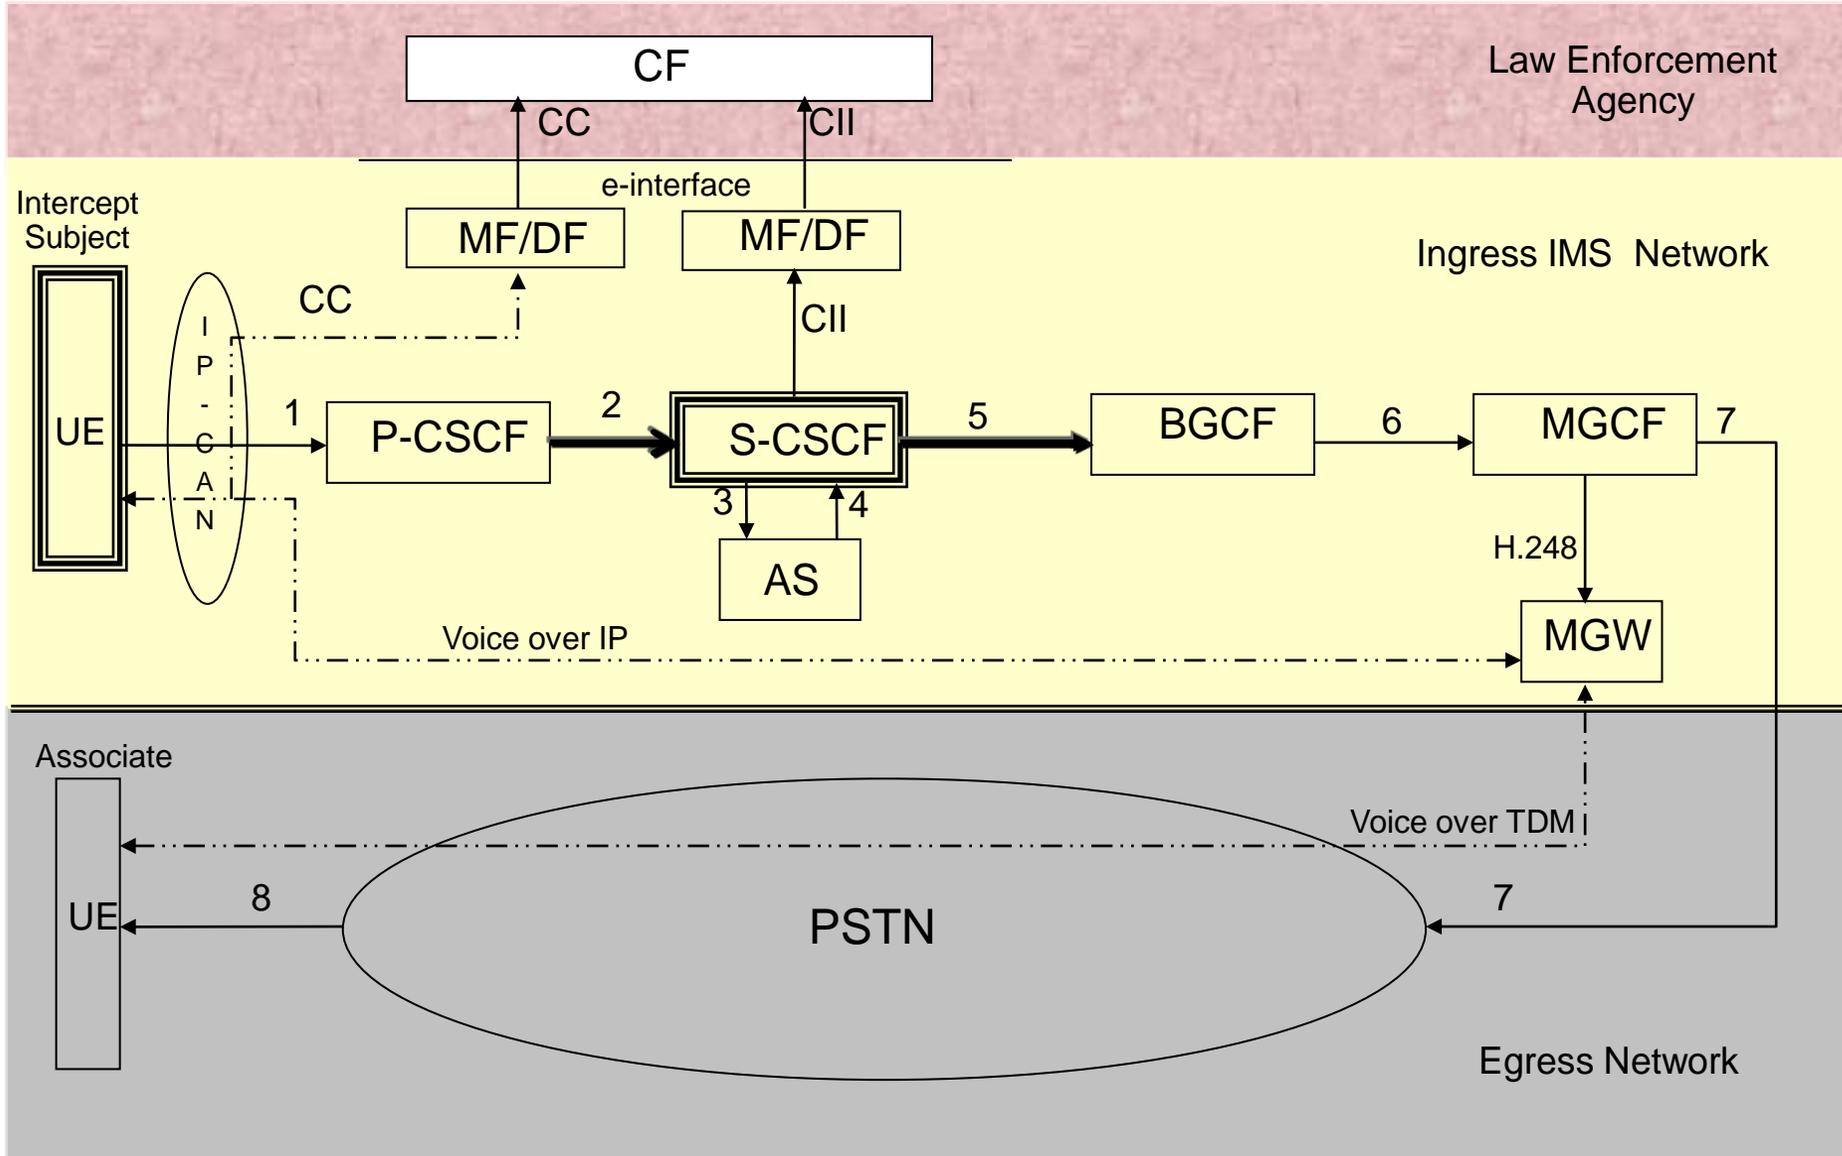

ATIS-0700005 Annex D Scenarios

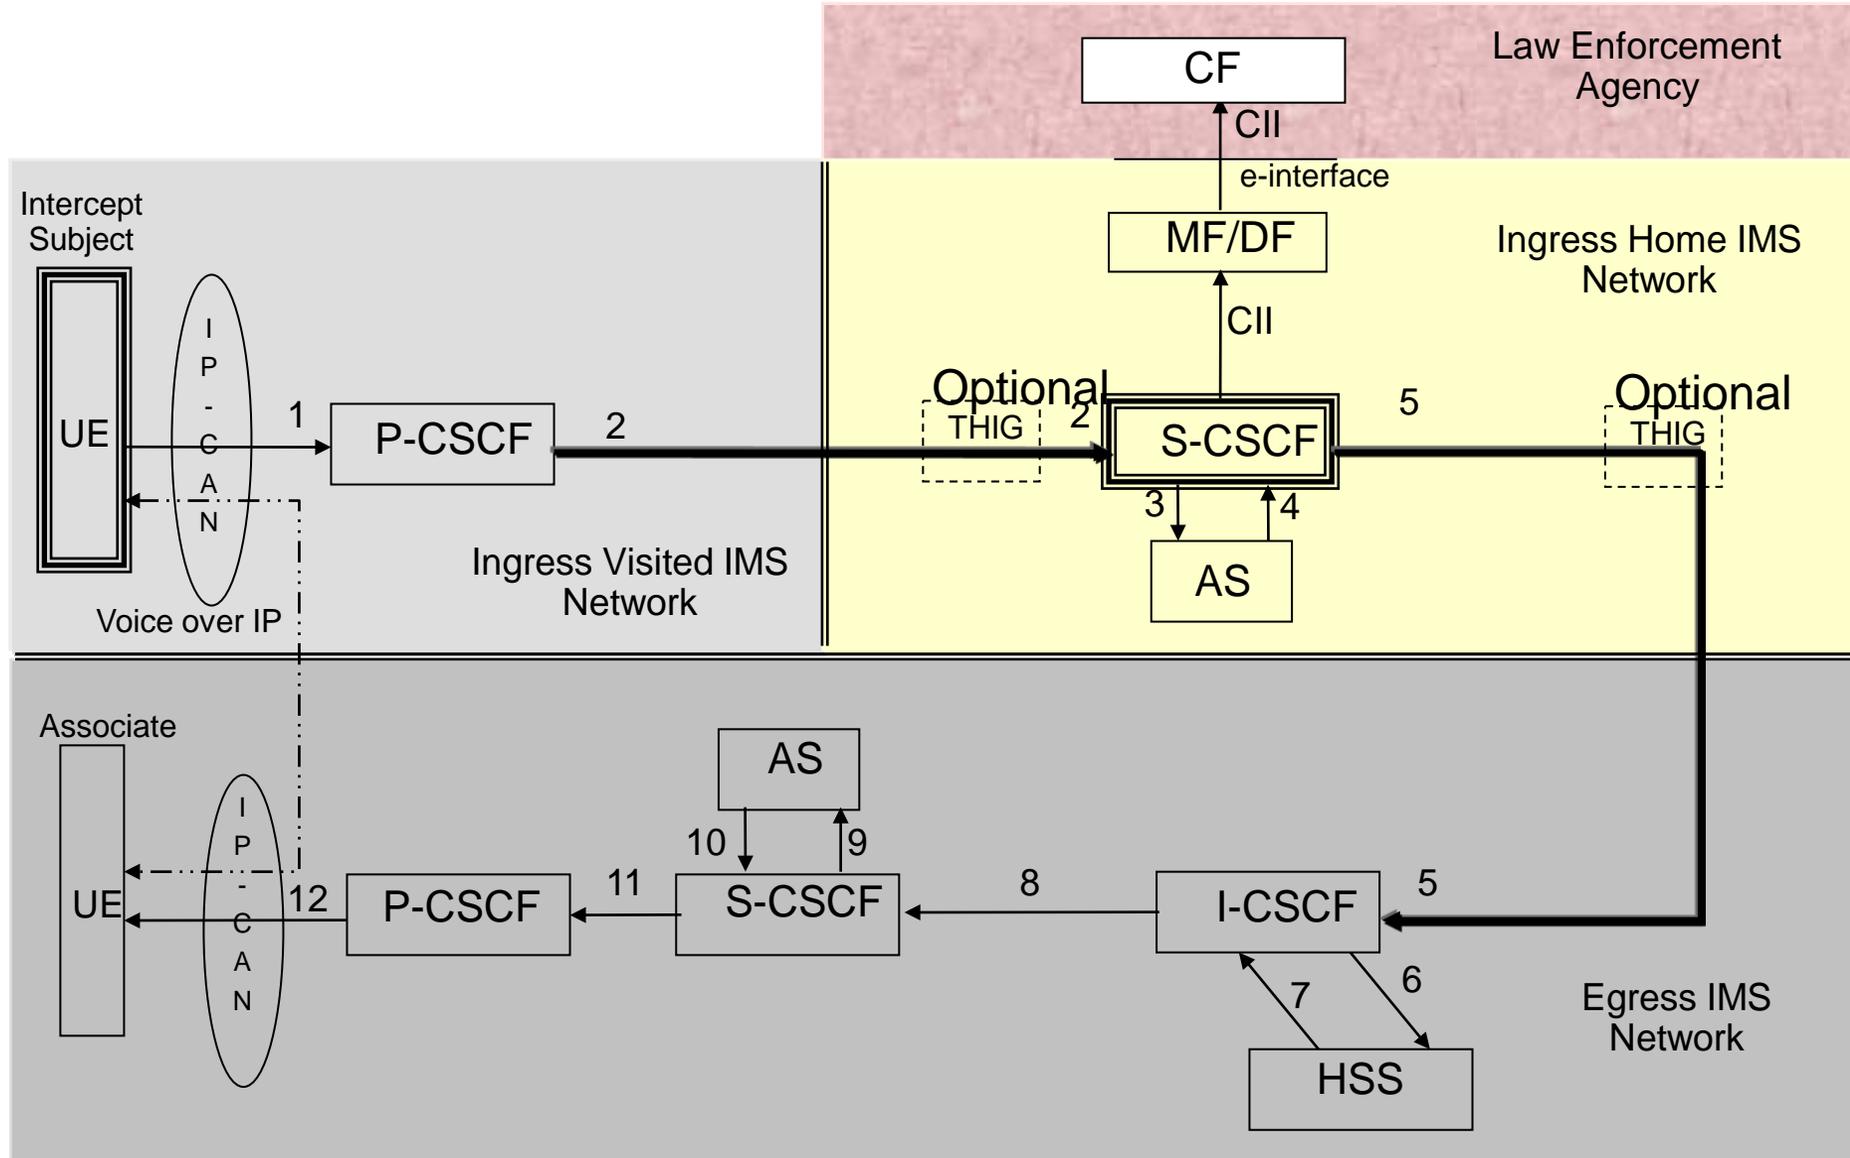

Call Origination – No IMS Roaming – IMS to IMS Call

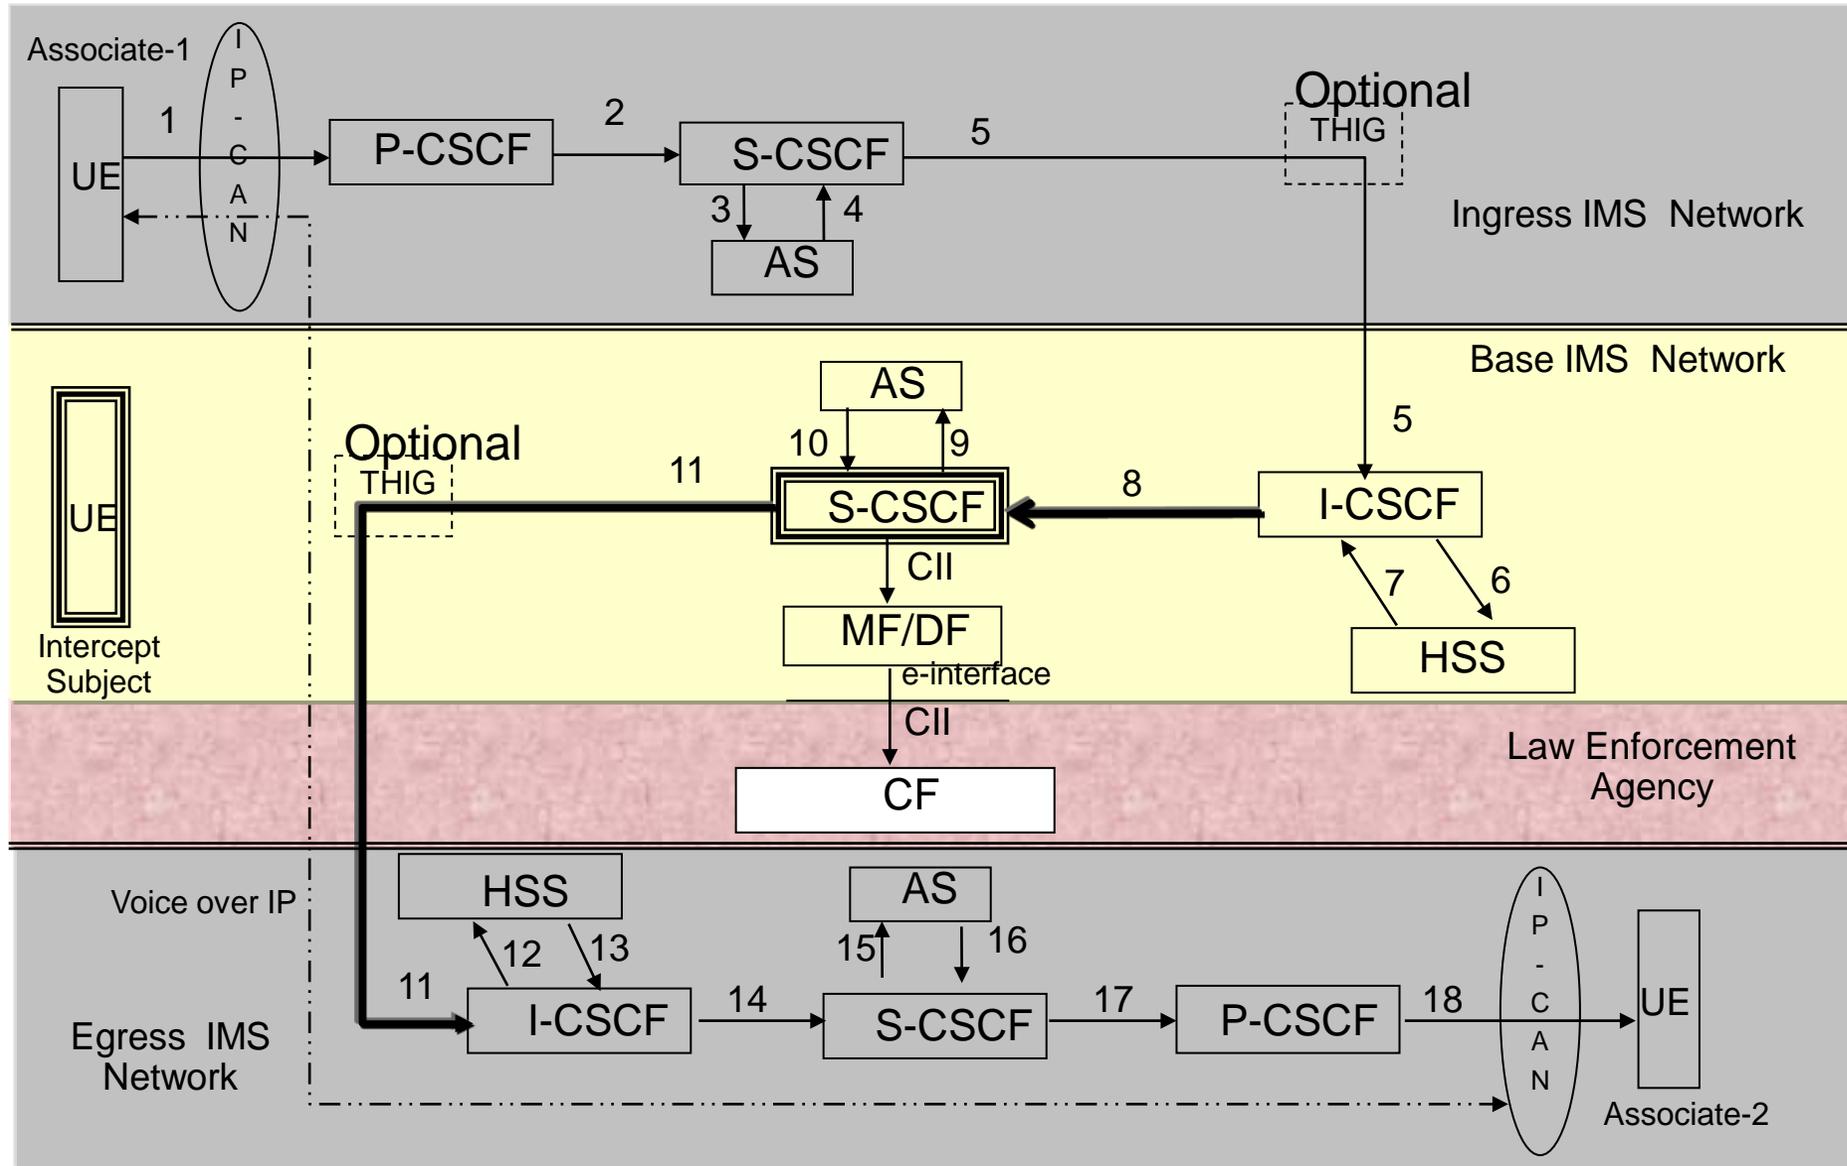

Call Origination – No IMS Roaming – IMS to PSTN Call

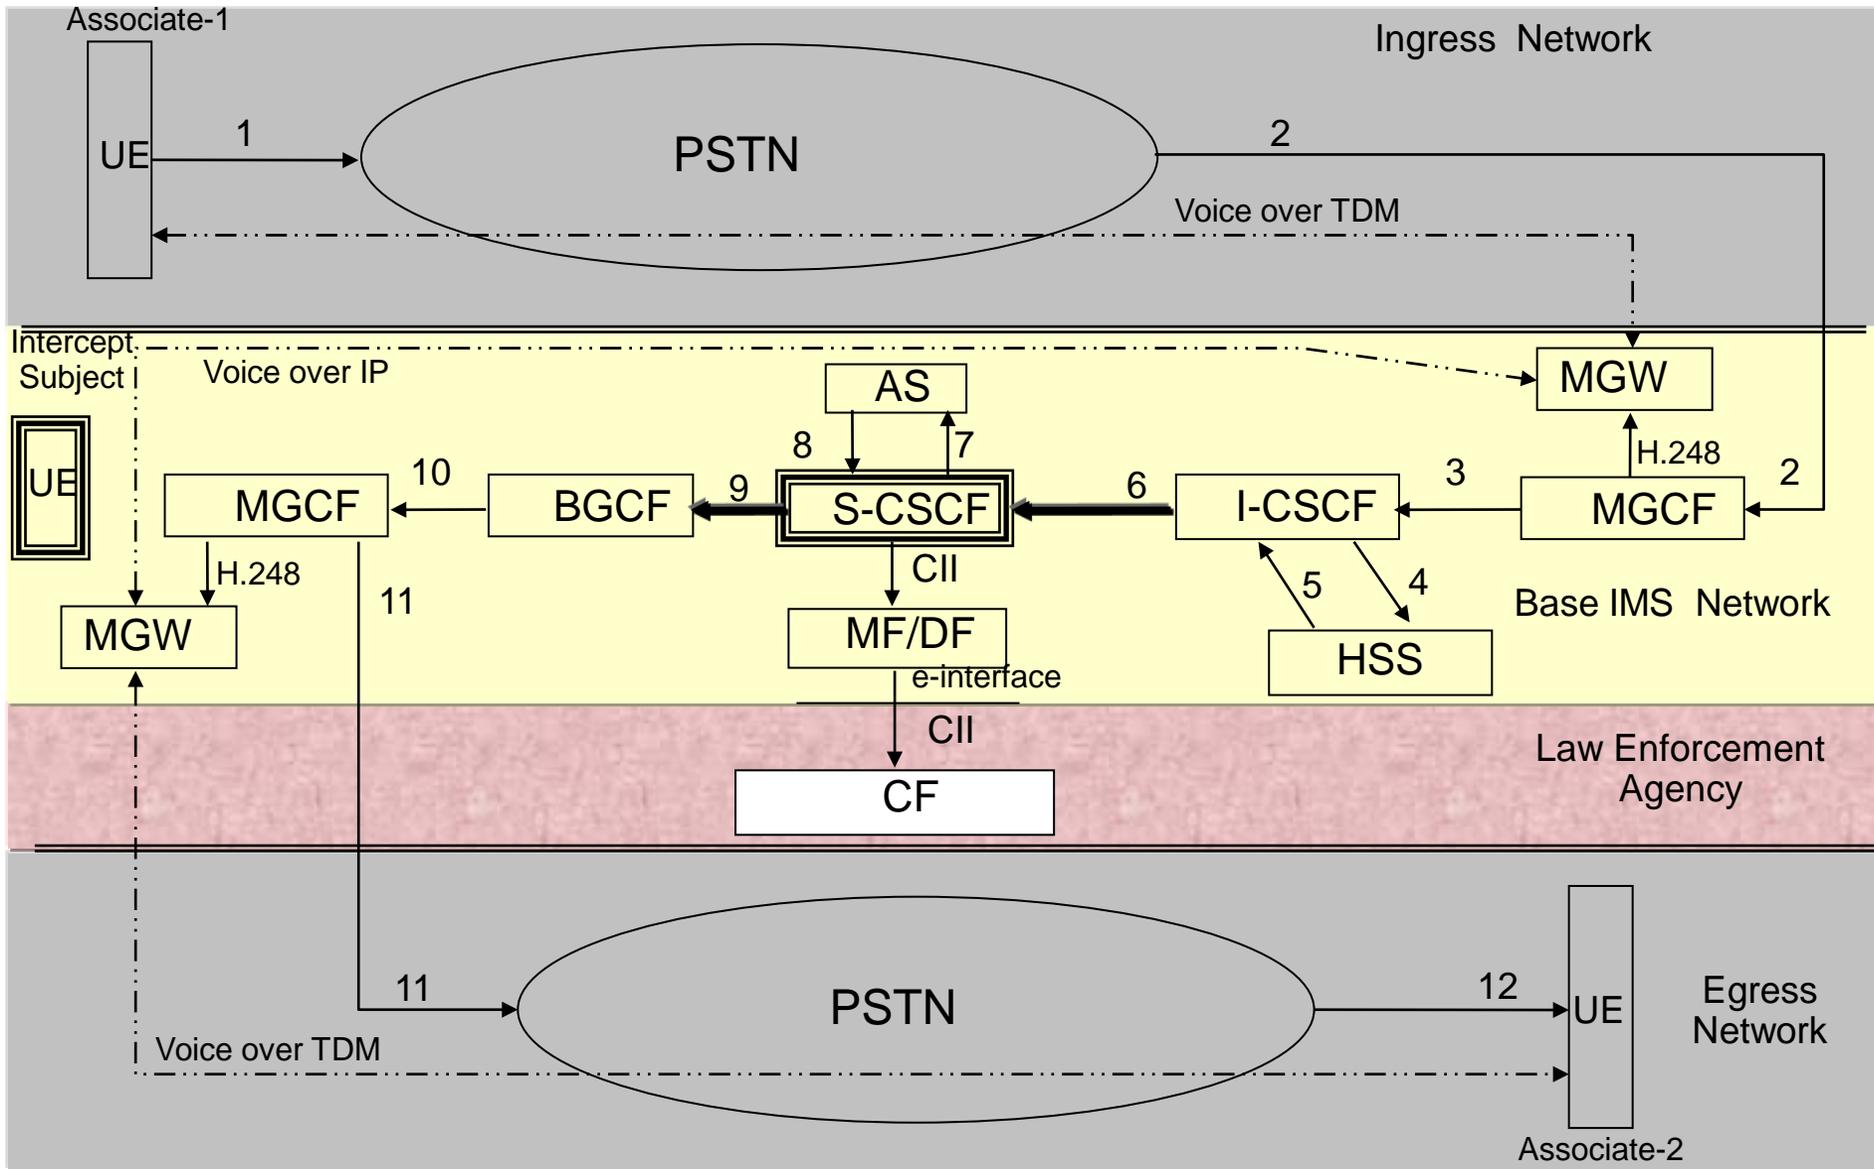

Call Origination – IMS Roaming – IMS to IMS Call

Call Forwarding Unconditional – IMS to IMS forwarded to IMS

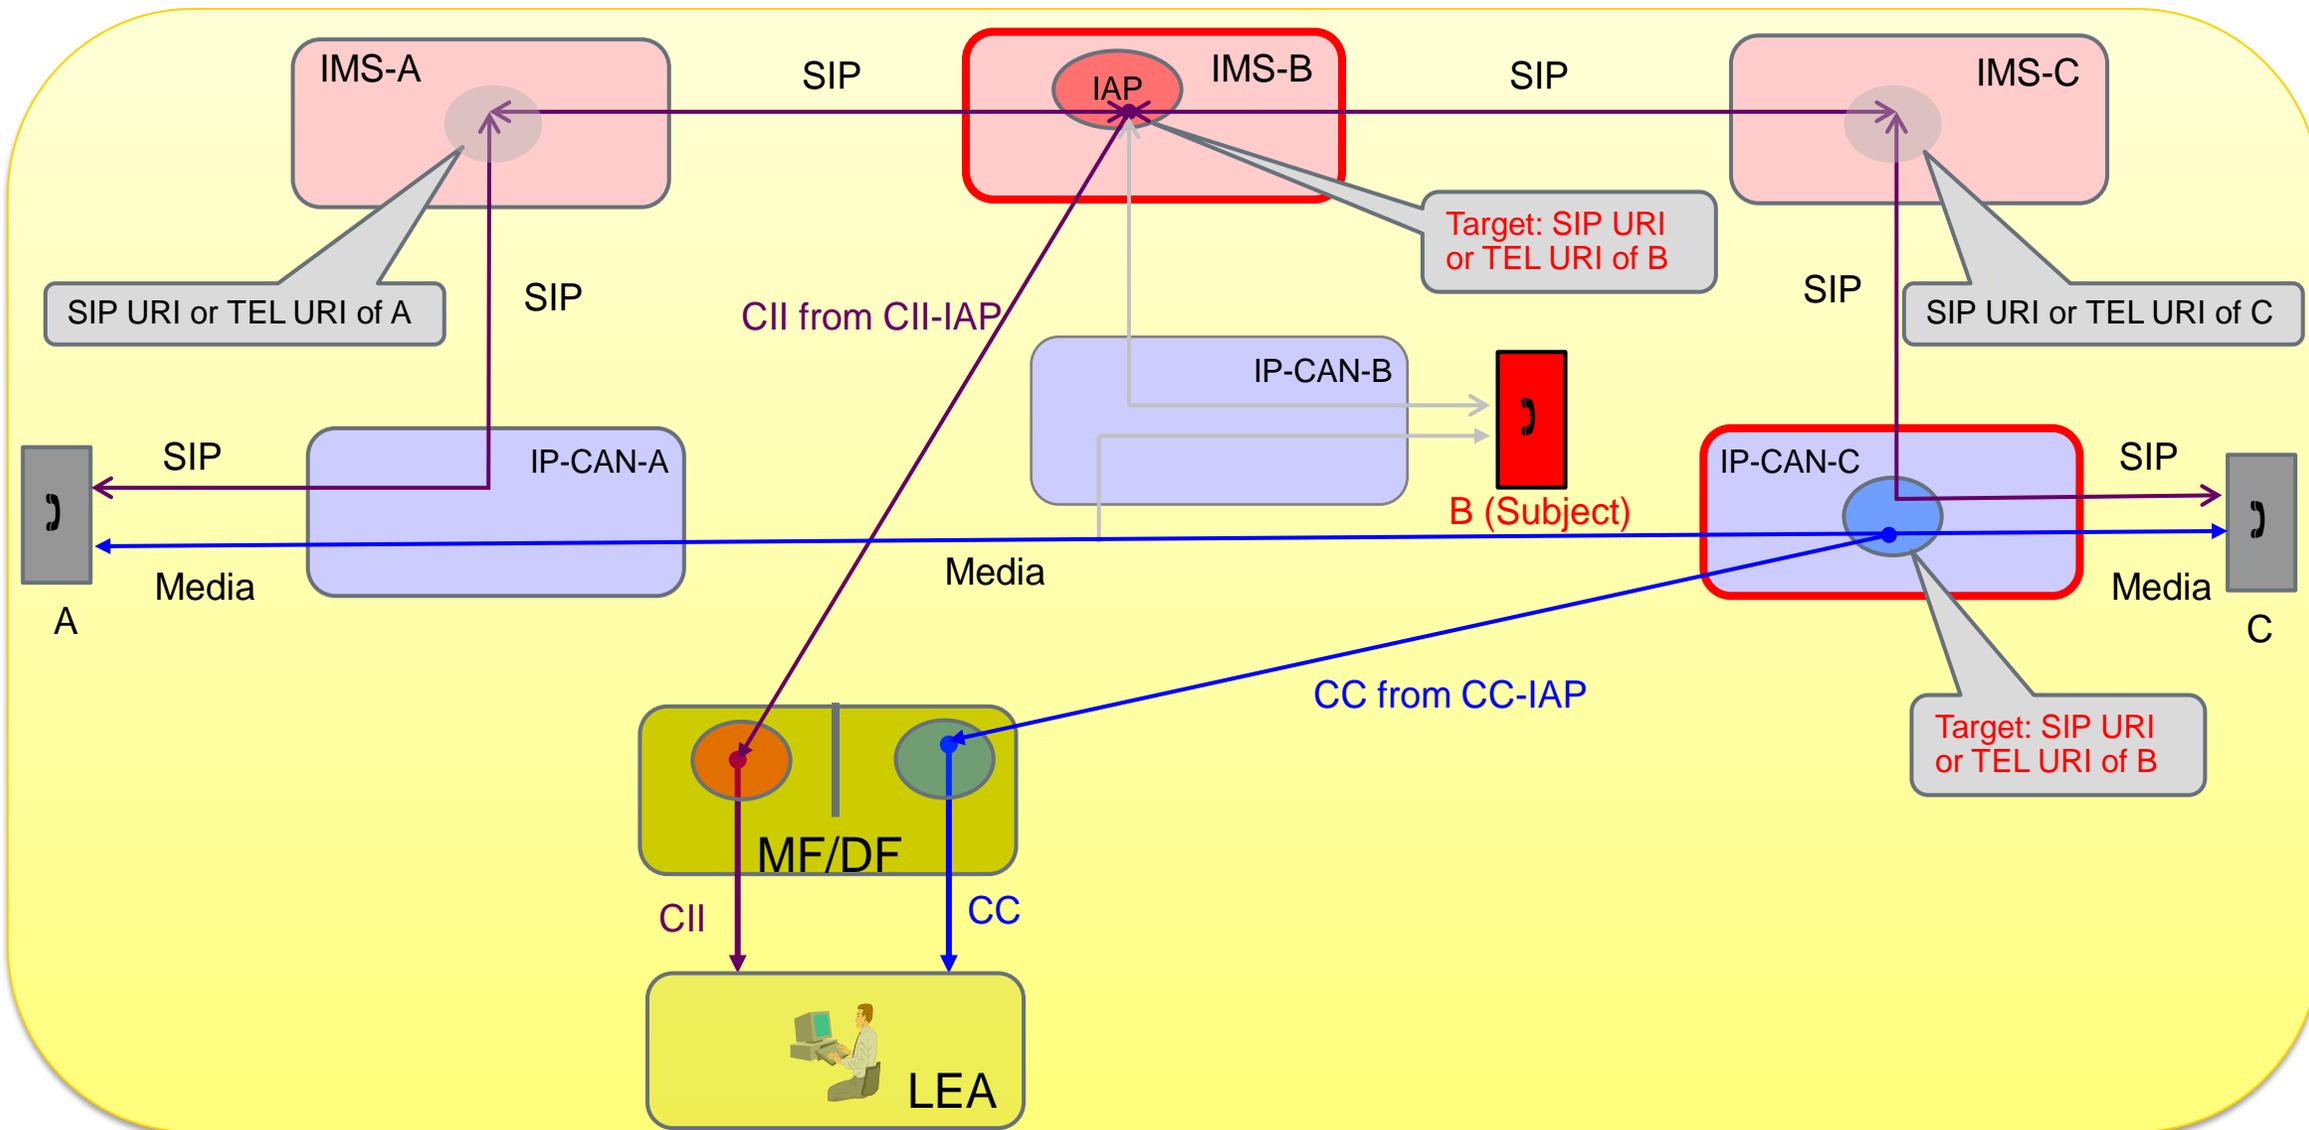

Call Forwarding Unconditional – PSTN to IMS forwarded to PSTN

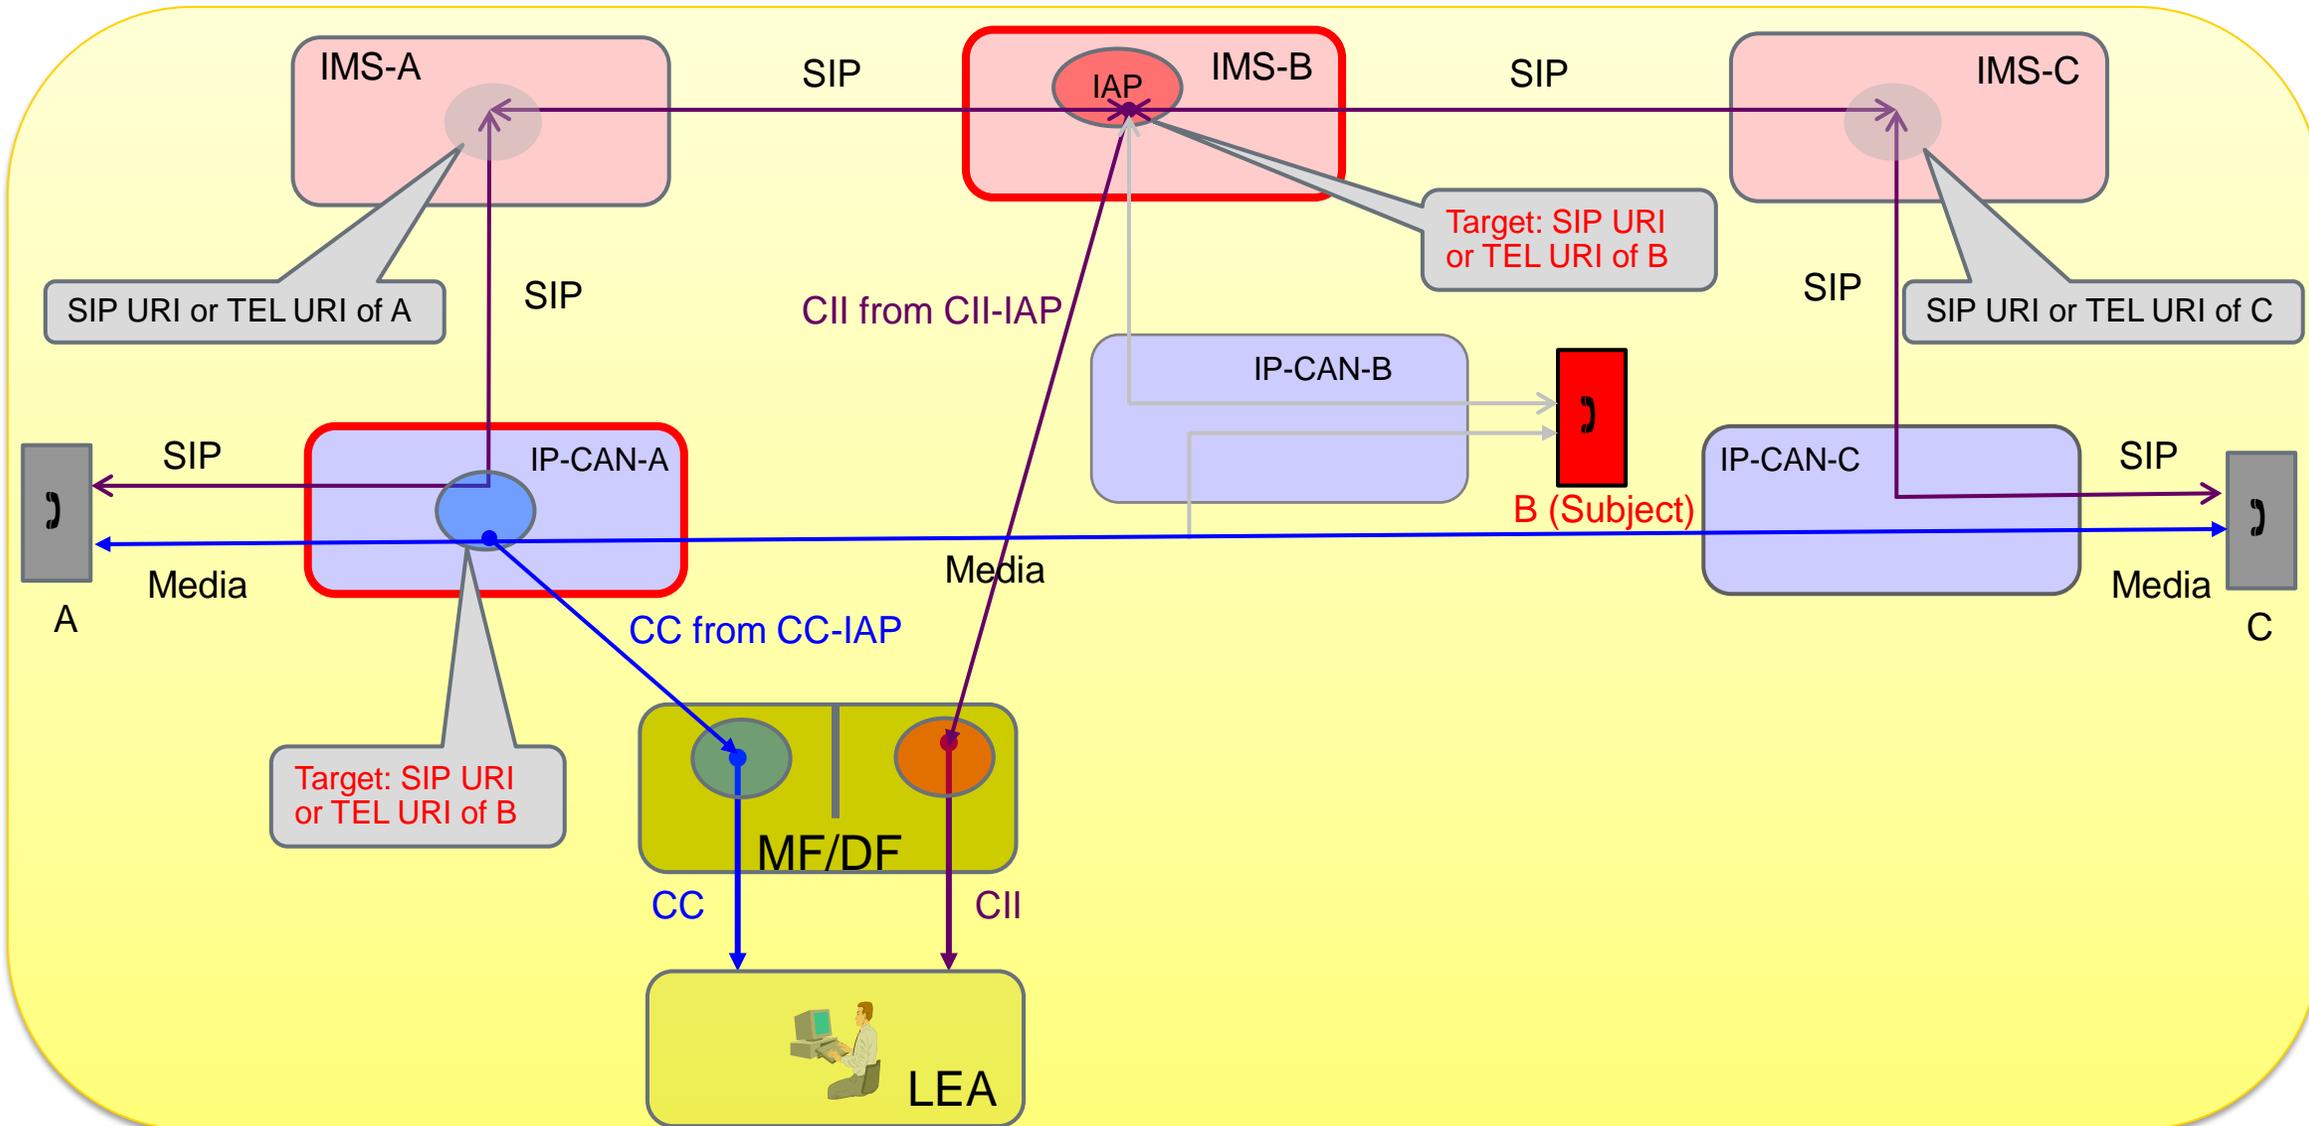

Solutions Business Need

CC Interception in Call Forwarding (a method)

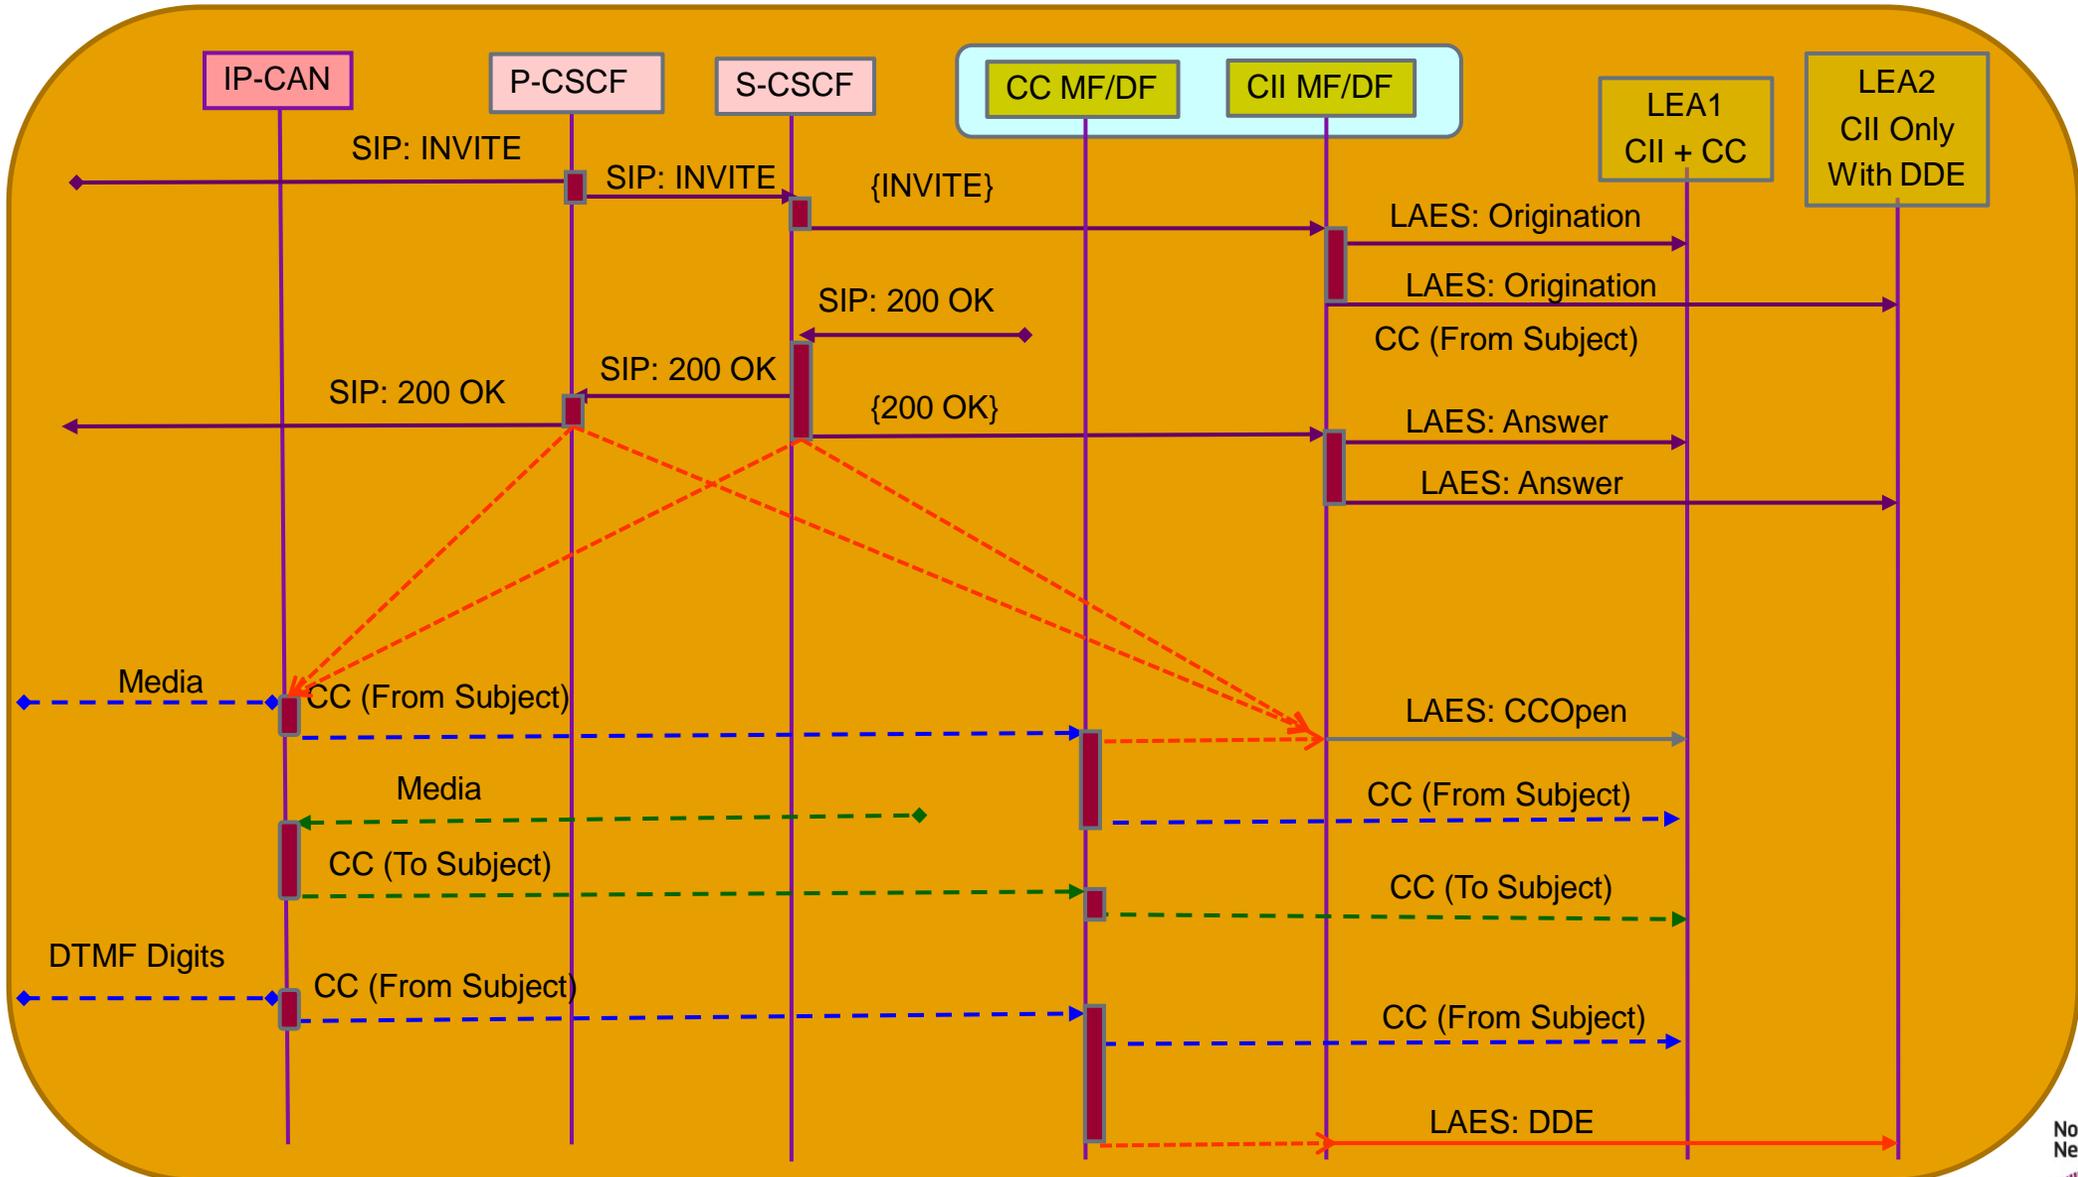

CC Interception in Call Forwarding (another method)

LAES Model in ETSI TC LI

Conclusion

New WTSC-LI Issue: CC Interception for IMS-based VoIP

- Only one Subject Identifier (SIP URL or TEL URL) for CII and CC Interception
- Intercept only voice packets as CC;
- CC interception for forwarded calls;
- Dynamic CC-IAP identification;
- Generation of CC-related events (CCOpen, CCClose);
- Extraction of DTMF digits from Subject voice-stream & generate DDE event.
- Correlation of CC with CII
- Real time interface to CC-IAP to trigger CC interception;
- Security measures to shield the intercept data
