

Agenda item:**Source: TSG_N WG2****Title: CRs to 3G TS 23.008, 23.016, 23.018, 29.002 (Work Item Multicall)**

Introduction:

This document contains **4 CRs on Work Item Multicall** agreed by **TSG_N WG2** and forwarded to **TSG_N Plenary** meeting #6 for approval.

TDoc	Spec	CR	Rev	Ph.	Cat	Old v.	New v.	Subject
N2-99H20	23.008	005	1	R99	B	3.1.0	3.2.0	Introduction of maximum number for CS
N2-99H21	23.016	005	1	R99	B	3.2.1	3.3.0	Introduction of maximum number for CS
N2-99H19	23.018	025	2	R99	B	3.2.0	3.3.0	Addition of the description for Multicall
N2-99J54	29.002	048	2	R99	B	3.2.0	3.3.0	Introduction of maximum number for CS

3GPP TSG-CN WG2
Phoenix, USA, 15-19 November 1999

Document **N2-99H20**

e.g. for 3GPP use the format TP-99xxx
or for SMG, use the format P-99-xxx

CHANGE REQUEST

Please see embedded help file at the bottom of this page for instructions on how to fill in this form correctly.

23.008 CR 005r1

Current Version: **3.1.0**

GSM (AA.BB) or 3G (AA.BBB) specification number ↑

↑ CR number as allocated by MCC support team

For submission to: **CN#06**
list expected approval meeting # here ↑

strategic
non-strategic (for SMG use only)

Form: CR cover sheet, version 2 for 3GPP and SMG The latest version of this form is available from: <ftp://ftp.3gpp.org/Information/CR-Form-v2.doc>

Proposed change affects: (U)SIM ME UTRAN / Radio Core Network
(at least one should be marked with an X)

Source: TSG N2 **Date:** 08/11/99

Subject: Introduction of maximum number for CS

Work item: Multicall

Category: <small>(only one category shall be marked with an X)</small>	F Correction	<input type="checkbox"/>	Release:	Phase 2	<input type="checkbox"/>
	A Corresponds to a correction in an earlier release	<input type="checkbox"/>		Release 96	<input type="checkbox"/>
	B Addition of feature	<input checked="" type="checkbox"/>		Release 97	<input type="checkbox"/>
	C Functional modification of feature	<input type="checkbox"/>		Release 98	<input type="checkbox"/>
D Editorial modification	<input type="checkbox"/>	Release 99	<input checked="" type="checkbox"/>		
			Release 00	<input type="checkbox"/>	

Reason for change: Regarding the stage1 specification for Multicall, we studied the necessity of additional data. It should be possible for the number of active calls supported simultaneously to be restricted by user subscription. The user subscription of the maximum number is stored in HLR, and sent to VLR when the Update Location procedure is raised.

Clauses affected:

Other specs affected:	Other 3G core specifications	<input checked="" type="checkbox"/>	→ List of CRs:	23.016, 23.018, 29.002
	Other GSM core specifications	<input type="checkbox"/>	→ List of CRs:	
	MS test specifications	<input type="checkbox"/>	→ List of CRs:	
	BSS test specifications	<input type="checkbox"/>	→ List of CRs:	
	O&M specifications	<input type="checkbox"/>	→ List of CRs:	

Other comments: According to the LS(S2-99C41), we have considered the deletion of the subscriber data for PS Multicall as an assumption.

<----- double-click here for help and instructions on how to create a CR.

2 Definition of subscriber data

2.5 Data related to basic services

2.5.1 Provision of bearer service

Provision of bearer service is a parameter identifying whether a bearer service is provisioned to the mobile subscriber or not. This provision can be achieved through subscription of the mobile subscriber or the bearer service can be generally available. The parameter "provision of bearer service" must be set for the bearer service defined in GSM 02.02 for which a subscription is required.

Provision of bearer service is permanent subscriber data and is stored in the HLR and VLR.

2.5.2 Provision of teleservice

Provision of teleservice is a parameter identifying whether a teleservice is provisioned to the mobile subscriber or not. This provision can be achieved through subscription of the mobile subscriber or the teleservice can be generally available. The parameter "provision of teleservice" must be set for the teleservices defined in GSM 02.03 for which a subscription is required.

Provision of teleservice is permanent subscriber data and is stored in the HLR, SGSN and VLR.

2.5.3 Bearer capability allocation

Bearer capability allocation is a parameter stored against each ISDN number in the case when the Home PLMN allocates one directory number per teleservice and bearer service. In this case it is used to permit the establishment of the correct bearer capability on the connection to the MS. (See GSM 09.07). The bearer capability allocation is not required when the Home PLMN only allocates one directory number per subscriber for all bearer services and teleservices. It is permanent data stored conditionally in both HLR and VLR.

2.5.4 Transfer of SM option

Transfer of SM option is a parameter indicating which path should be used for transfer of Terminating Short Message when GPRS is not supported by the GMSC. Two options are possible :

- « transfer of SM via the MSC when GPRS is not supported in the GMSC » : this option is used to indicate that SM shall always be sent via the MSC when the GMSC does not support the GPRS functionality.
- « transfer of SM via the SGSN when GPRS is not supported in the GMSC » : this option is used to indicate that SM shall always be sent via the SGSN when the GMSC does not support the GPRS functionality.

Transfer of SM option is permanent subscriber data stored in HLR for a GPRS subscription.

The data has an interim nature since in the final solution, the decision on SM Transfer is taken in the SMS-GMSC.

2.5.5 Maximum call number

Maximum call number is a parameter identifying whether a multicall is provisioned to the mobile subscriber or not and indicating the number of active calls supported simultaneously as subscription option. This provision can be achieved through subscription of the mobile subscriber. The maximum call number is permanent data stored conditionally in both VLR and HLR.

***** Next Modified Section *****

4 Accessing subscriber data

It shall be possible to retrieve or store subscriber data concerning a specific MS from the HLR by use of each of the following references:

- International Mobile Subscriber Identity (IMSI);
- Mobile Station ISDN Number (MSISDN)

It shall be possible to retrieve or store subscriber data concerning a specific MS from the VLR by use of each of the following references:

- International Mobile Subscriber Identity (IMSI);
- Temporary Mobile Subscriber Identity (TMSI).

It shall be possible to retrieve or store subscriber data concerning a specific MS from the SGSN by use of each of the following references:

- International Mobile Subscriber Identity (IMSI);
- Packet Temporary Mobile Subscriber identity (P-TMSI).

It shall be possible to retrieve or store subscriber data concerning a specific MS from the GGSN by use of each of the following references:

- International Mobile Subscriber Identity (IMSI);

See clause 3 for explanation of M, C, T and P in table 1 and table 2.

NOTE: The HLR column indicates only GPRS related use, i.e. if the HLR uses a parameter in non-GPRS Network Access Mode but not in GPRS Network Access Mode, it is not mentioned in this table 2.
(Gs): The VLR column is applicable if Gs interface is installed. It only indicates GPRS related data to be stored and is only relevant to GPRS subscribers registered in VLR.

a): This parameter is relevant in the SGSN only when the Gs interface is installed.

NOTE: For special condition of storage see in the clauses 2.x.y referred-to.
See clause 3 for explanation of M,C,T and P in table 2.

3 Definitions and abbreviations

3.1 Abbreviations

Abbreviations used in this specification are listed in GSM 01.04.

3.2 Definitions

Subscriber data to be stored in the HLR, VLR and SGSN are defined in GSM 03.08, and in GSM 03.6x, GSM 03.8x and GSM 03.9x-series of technical specifications.

Voice Broadcast Service (VBS), Voice Group Call Service (VGCS) and enhanced Multi Level Precedence and Pre-emption Service (eMLPP) Data related to group call area, cell or dispatcher attributes is only stored in the Group Call Register (GCR) which is linked to each MSC/VLR.

The GCR and it's stored data is out of scope of this specification.

Subscriber related VBS, VGCS and eMLPP Data only concerns entitlement data for these-services and is seen as shared non-GPRS subscriber data.

GPRS and non-GPRS subscriber data:

The HLR has to download data to the VLR and to the SGSN. In this specification those data sent to the VLR are called non-GPRS subscriber data and those data sent to the SGSN are called GPRS subscriber data.

Whenever the refining identifier non-GPRS or GPRS is missing a common rule is addressed which hold for both kinds of subscriber data.

Subscriber data specific to non-GPRS shall only be sent from the HLR to the VLR. Subscriber data specific to GPRS shall only be sent from the HLR to the SGSN.

Subscriber data common to both non-GPRS and GPRS (regional subscription information) are downloaded from the HLR to both entities.

Shared non-GPRS subscriber data:

Common subset of subscriber data defined to be stored in both the HLR and VLR. Subscriber data only stored in the HLR is not part of shared subscriber data. Shared subscriber data includes:

- BS: Bearer Service (see GSM 02.02);
- TS: Teleservice (see GSM 02.03);
- BSG: Basic Service Group (see GSM 02.01, GSM 02.04 and GSM 03.11);
- EBSG: Elementary Basic Service Group (see GSM 03.11);
- CBSG: Collective Basic Service Group (see GSM 03.11).
- LSA Information: Localised Service Area Information (see GSM 03.73).

Shared GPRS subscriber data:

Common subset of subscriber data defined to be stored in both the HLR and SGSN. Subscriber data only stored in the HLR is not part of shared subscriber data. Shared GPRS subscriber data includes:

- TS: Teleservice (see GSM 02.03);
- PDP Context (see GSM 03.60).
- LSA Information: Localised Service Area Information (see GSM 03.73).

Mandatory data:

Data required to form a self-consistent set of subscriber data. The context governs whether a specific parameter is mandatory, e.g. the data set for a specific service may be optional, however if data for this service is present, then parameters within this data set may be mandatory.

Mandatory data is defined by the service description (see e.g. GSM 03.6x, GSM 03.8x and GSM 03.9x-series of technical specifications and GSM 03.15) and by PLMN defined requirements.

NOTE 1: The above definition is seen from a semantic point of view. Semantically, mandatory parameters may be defined as syntactically optional or mandatory by the protocol.

Optional data:

Data which is defined as subscriber data, but which is not required to form a self-consistent set of subscriber data; the context governs whether a specific parameter is optional.

Optional data is data which is defined by the service description (see e.g. GSM 03.6x, GSM 03.8x and GSM 03.9x-series of technical specifications and GSM 03.15) or by PLMN defined requirements but is not defined as mandatory data.

NOTE 2: The above definition is seen from a semantic point of view. Semantically optional parameters are always defined as syntactically optional by the protocol.

Missing data:

Data which is mandatory in a given context but is not received nor is valid data available locally.

Unexpected data:

Data which is received and cannot be further processed. This may be either:

- optional data not required in a given context; or
- optional or mandatory data, required in this context but received with an unexpected value.

Overlapping data:

Two different cases of overlapping within subscriber data are possible:

- two or more parameters are to be stored at the same address in the data structure (see subclause 4.4);
- two or more BSGs within a BSG list include or are identical with one and the same EBSG.

The following **groups of non-GPRS subscriber information** are defined:

- subscriber information (Group A):
 - International Mobile Subscriber Identity (IMSI);
 - basic Mobile Station International ISDN Number (MSISDN);
 - category;
 - subscriber status;
- basic service information (Group B):
 - Bearer Service list;
 - Teleservice list.

NOTE 3: VBS and VGCS entitlement data are subsumed under Teleservices

- Supplementary Service (SS) information (Group C):
 - forwarding information;
 - call barring information;
 - Closed User Group (CUG) information;
 - eMLPP data;
 - SS Data;
- Operator Determined Barring (ODB) information (Group D):

- ODB Data for non-GPRS services;
- roaming restriction information (Group E):
 - roaming restriction due to unsupported feature;
- regional subscription information (Group F):
 - regional subscription data.
- VBS/VGCS subscription information (Group G):
 - VBS subscription data;
 - VGCS subscription data.
- CAMEL subscription information (Group H):
 - Originating CAMEL Subscription Information.
- LSA Information (Group I):
 - LSA data.
- Multicall Information (Group J):
 - maximum call number

The following **groups of GPRS subscriber information** are defined:

- subscriber information (Group P1):
 - International Mobile Subscriber Identity (IMSI);
 - basic Mobile Station International ISDN Number (MSISDN);
 - subscriber status;
- basic service information (Group P2):
 - Teleservice list.
- Operator Determined Barring (ODB) information (Group P3):
 - ODB Data for GPRS services;
- roaming restriction information (Group P4):
 - roaming restriction in SGSN due to unsupported feature;
- regional subscription information (Group P5):
 - regional subscription data.
- GPRS subscription information (Group P6):
 - GPRS subscription data.
- LSA Information (Group P7):
 - LSA data.

****** Next Modified Section ******

4 General on handling of subscriber information

4.3 Order of information and distribution over message boundaries

4.3.1 Order of information sent by the HLR

The order of information is defined by the order in which the transfer syntax is generated by the HLR. This includes a sequence of messages as well as the syntax within a message (first to last message, component, operation, parameter, etc.).

With the above definitions, the following rules shall apply for non-GPRS subscriber data for the order of information within an HLR-VLR dialogue:

- Group A information (subscriber status) shall be sent first;
- Group B information shall be sent after Group A information and before any Group C, E, F, ~~G~~ H or J information;
- Group D information shall be sent after Group A information and in any order with respect to Group B, C, E, F, ~~G~~ H and J information.
- a specific order of Group C, E, F, ~~G~~ H or J information is not required.

There is no requirement for the sending of subscriber information groups in the same message.

With the above definitions, the following rules shall apply for GPRS subscriber data for the order of information within a dialogue:

- Group P1 information (subscriber status) shall be sent first;
- Group P2 information shall be sent after P1 information and before P4 and P5 information
- Group P3 information shall be sent after Group P1 information and in any order with respect to Group P2, P4, P5 and P6 information.
- a specific order of Group P4, P5 and P6 information is not required.

****** Next Modified Section ******

4.5 Handling of supplementary service data with respect to basic service data

4.5.4 Consistency of supplementary service data

In some cases, the protocol used between the HLR and VLR encodes some data that is not EBSG-related SS data with an EBSG qualifier. In this case, the HLR shall ensure that when this data is sent it is always the same for all EBSGs. If this data is modified, the HLR must send the supplementary service data to the VLR for all EBSGs which meet all the following criteria:

- at least one basic service in the EBSG is supported; and
- the supplementary service is applicable to at least one (possibly different) basic service in the EBSG; and
- the subscriber has a subscription to at least one (possibly different) basic service in the EBSG.

D Editorial modification

Release:

Phase 2
Release 96
Release 97
Release 98
Release 99
Release 00

Reason for change:

Regarding the stage1 specification for Multicall, we studied the necessity of multicall subscription check procedure. The number of active calls supported simultaneously shall be restricted by user subscription. The maximum number of CS calls is set in VLR and multicall subscription check procedure in VLR is applied to both MO and MT.

5 Information flows

5.1 Information flow for an MO call

An example information flow for an MO call is shown in figure 1; many variations are possible. Signalling over the radio interface between MSA and BSSA or VMSCA is shown by dotted lines; signalling over the "A" interface between BSSA and VMSCA is shown by dashed lines; signalling over the B interface between VMSCA and VLRA is shown by chain lines; and ISUP signalling between VMSCA and the destination exchange is shown by solid lines.

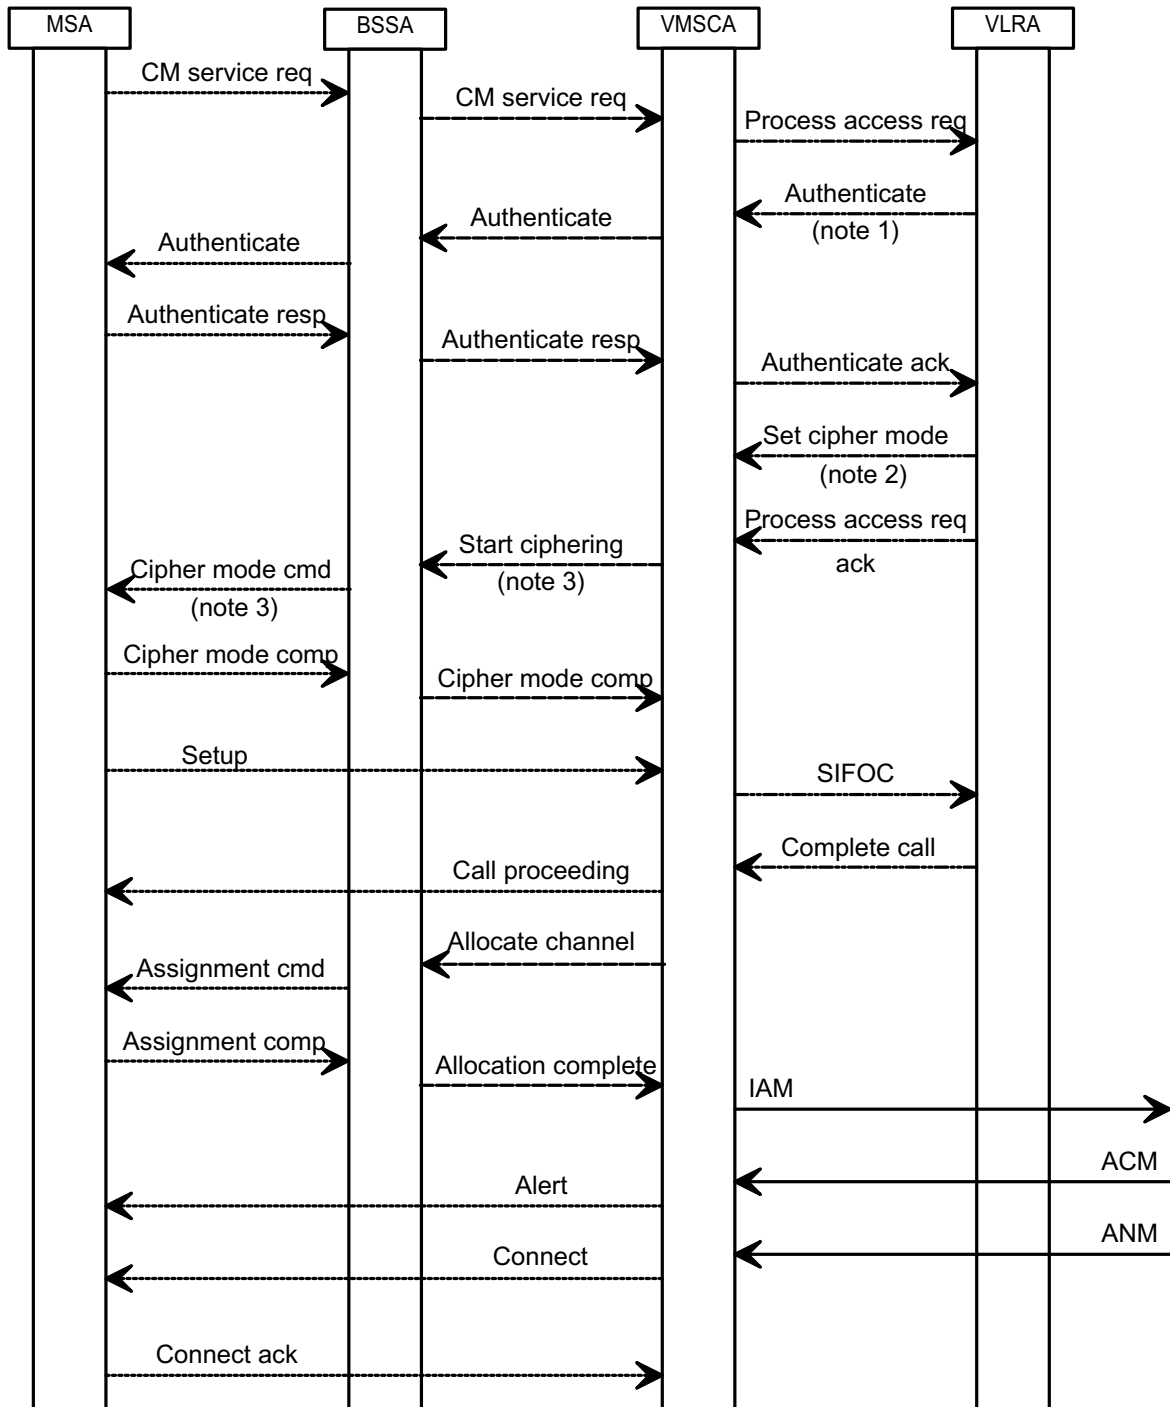

Figure 1: Information flow for a basic mobile originated call

NOTE 1: Authentication may occur at any stage during the establishment of an MO call; its position in this message flow diagram is an example.

NOTE 2: Ciphering may be initiated at any stage after authentication; its position in this message flow diagram is an example.

NOTE 3: If ciphering is not required, the MSC may send a CM service accept towards the MS; optionally it may instead send a "start ciphering" request indicating that no ciphering is required.

NOTE 4: The network may request the IMEI from the MS, and may check the IMEI, at any stage during the establishment of an MO call, either as part of the procedure to start ciphering or explicitly after ciphering has started; this is not shown in this message flow diagram.

When the user wishes to originate a call, MSA establishes a signalling connection with BSSA, and sends a Connection Management (CM) service request to BSSA, which relays it to VMSCA. VMSCA sends a Process access request to VLRA. VLRA may then initiate authentication, as described in GSM 03.20. VLRA may also initiate ciphering at this stage, as described in GSM 03.20. If the user originates one or more new MO calls in a multicall configuration, MSA sends a CM service request through the existing signalling connection for each new call.

If VLRA determines that MSA is allowed service, it sends a Process access request ack to VMSCA. If VMSCA has received a Set cipher mode message from VLRA, the Process access request ack message triggers a Start ciphering command message towards BSSA; otherwise VMSCA sends a CM service accept message towards BSSA.

If BSSA receives a Start ciphering command from VMSCA, it initiates ciphering as described in GSM 03.20 ; when ciphering is successfully initiated, MSA interprets this in the same way as a CM service accept. If ciphering is not required at this stage, BSSA relays the CM service accept to MSA.

When MSA has received the CM service accept, or ciphering has been successfully initiated, MSA sends a Setup message containing the B subscriber address via BSSA to VMSCA. MSA also uses the Setup message to indicate the bearer capability required for the call; VMSCA translates this bearer capability into a GSM basic service, and determines whether an interworking function is required. VMSCA sends to VLRA a request for information to handle the outgoing call, using a Send Info For Outgoing Call (SIFOC) message containing the B subscriber address.

If VLRA determines that the call should be connected, it sends a Complete Call message to VMSCA. VMSCA sends a Call Proceeding message via BSSA to MSA, to indicate that the call request has been accepted, and sends an Allocate channel message to BSSA, to trigger BSSA and MSA to set up a traffic channel over the radio interface. The Call Proceeding message includes bearer capability information if any of the negotiable parameters of the bearer capability has to be changed. When the traffic channel assignment process is complete (indicated by the Allocation complete message from BSSA to VMSCA), VMSCA constructs an ISUP IAM using the B subscriber address, and sends it to the destination exchange.

When the destination exchange returns an ISUP Address Complete Message (ACM), VMSCA sends an Alert message via BSSA to MSA, to indicate to the calling user that the B subscriber is being alerted.

When the destination exchange returns an ISUP ANswer Message (ANM), VMSCA sends a Connect message via BSSA to MSA, to instruct MSA to connect the speech path.

The network then waits for the call to be cleared.

For an emergency call, a different CM service type (emergency call) is used, and the mobile may identify itself by an IMEI. It is a network operator option whether to allow an emergency call when the mobile identifies itself by an IMEI. Details of the handling are shown in clause.

7 Functional requirements of network entities

7.1 MO call

7.1.2 Functional requirements of VLR

7.1.2.3 Procedure OG_Call_Subscription_Check_VLR

Sheet 1: the procedure Check_OG_Multicall is implementation option. If the VLR does not support Multicall, processing continues from the "Yes" exit of the test "Result=Call allowed?".

Sheet 1: it is an implementation option to carry out the check for operator determined barring of all outgoing calls before the check on provisioning of the requested basic service.

Sheet 1: the procedure OG_CUG_Check is specific to CUG. If the VLR does not support CUG, processing continues from the "Yes" exit of the test "Result=Call allowed?".

Sheet 1: the procedure Get_LI_Subscription_Info_MO_VLR is specific to CLIR and COLP. If the VLR supports neither CLIR nor COLP, the procedure call is omitted.

Sheet 1: the procedure Get_AoC_Subscription_Info_VLR is specific to AoC.

Sheet 1: the procedure UUS_OCH_Check_Provision is specific to UUS; it is specified in GSM 03.87. If the VMSC does not support UUS, processing continues from the "Yes" exit of the test "Result=Pass?".

Sheet 2: the procedure CAMEL_OCH_VLR is specific to CAMEL; it is specified in GSM 03.78 for CAMEL Phase 1 and GSM 03.78 for CAMEL Phase 2 . If the VLR does not support CAMEL, processing continues from connector 1 to the call to the procedure Check_OG_Barring.

Sheet 2: the negative response "call barred" indicates whether the reason is operator determined barring or supplementary service barring, according to the result returned by the procedure Check_OG_Barring.

****** Next Modified Section ******

7.1.2.17 Procedure Check_OG_Multicall

If the VLR doesn't have multicall subscription data, the maximum number of simultaneous bearer is regarded as one.

****** Next Modified Section ******

7.3 MT call

7.3.1 Functional requirements of serving MSC

7.3.1.2 Procedure Page_MS_MSC

Sheet 1: the test "MS connection exists" takes the "Yes" exit if there is a radio connection established between the MS and the network.

Sheet 1: for an SMS or SS page, the test "Call still exists" takes the "Yes" exit if the SMS or SS transaction which led to the page still exists.

Sheet 1: the test "SMS or SS page" is not required for the handling of circuit-switched calls, because the VLR will always use a page type of "circuit-switched call", but the more generalized procedure Page_MS_MSC is equally applicable to paging for SMS delivery or network-initiated SS procedures.

Sheet 1: the test "MS busy" takes the "Yes" exit if the MS is engaged on a circuit-switched call.

Sheet 1: If the MSC support Multicall service, the MSC shall send the number of active calls to VLR.

Sheet 1: the test "Call in setup" takes the "Yes" exit if the call on which the MS is engaged has not reached the established phase (called party answer).

Sheet 1: the test "Call waiting" takes the "Yes" exit if a waiting call has been offered to the subscriber but the outcome of offering the call has not been determined.

Sheet 1: the negative response Busy Subscriber (More calls possible) includes the basic service which applies for the established call.

Sheet 2: the signal input "MS connection established" indicates that the MS has responded to paging, or sent a CM service request for anything other than a circuit-switched call, or completed the location registration procedure.

****** Next Modified Section ******

Procedure Page_MS_MSC

PAGE_M1(2)

Procedure in the MSC to page an MS in a specified location area

Signals to/from the left are to/from the BSS; signals to/from the right are to/from the VLR unless marked otherwise

Paging via SGSN possible?

In specified location area

*** Next Modified Section ***

7.3.2 Functional requirements of VLR

7.3.2.1 Process ICH_VLR

Sheet 1: if the MSRN received in the Send Info For Incoming Call is not allocated or there is no IMSI record for the IMSI identified by the MSRN, this is treated as an unknown MSRN.

Sheet 1: the procedure CCBS_ICH_Set_CCBS_Call_Indicator is specific to CCBS; it is specified in GSM 03.93.

Sheet 1: the test "Paging via SGSN possible" takes the "yes" exit if:

- the Gs interface is implemented; and
- there is an association established for the MS between the MSC/VLR and the SGSN.

Sheet 1, sheet 2, sheet 3: the procedure CCBS_ICH_VLR_Report_Failure is specific to CCBS; it is specified in GSM 03.93.

Sheet 1, sheet 2: the procedure CCBS_ICH_Report_Not_Reachable is specific to CCBS; it is specified in GSM 03.93.

Sheet 2: the procedure Check_MT_Multicall_VLR is implementation option. If the maximum number has been reached, the test "NDUB?" shall take .

Sheet 2: the test "NDUB?" takes the "Yes" exit if the Page MS negative response or the Search for MS negative response had the value Busy Subscriber (NDUB).

Sheet 2: the procedure Get_CW_Subscription_Info_VLR is specific to Call Waiting. If the VLR does not support Call Waiting, processing continues from the "No" exit of the test "CW available?".

Sheet 2: the VLR uses the basic service returned in the Page MS negative response or the Search for MS negative response Busy Subscriber (More calls possible) to determine whether call waiting is available.

Sheet 2: the procedure Get_LI_Subscription_Info_MT_VLR is specific to CLIP and COLR. If the VLR supports neither CLIP nor COLR, the procedure call is omitted.

Sheet 2: the procedure Get_AoC_Subscription_Info_VLR is specific to AoC; it is specified in subclause 7.1.2.15.

Sheet 2 sheet 4: the procedure CLI_ICH_VLR_Add_CLI is specific to Enhanced CLI Handling. It is specified in GSM 03.81.

Sheet 2: the procedure CCBS_ICH_Handle_NDUB is specific to CCBS; it is specified in GSM 03.93. If the VLR does not support CCBS, processing continues from the "Forward" exit of the test "Result".

Sheet 2: the procedure Process_Access_Request_VLR is specified in subclause.

Sheet 2: the output signal Page MS towards the SGSN includes the Location area identity parameter.

Sheet 2: if the VLR does not support CUG, handling continues from the "No" exit of the test "CUG info present?".

Sheet 3, sheet 4: the procedure CD_Authorization is specific to Call Deflection, it is specified in GSM 03.72. If the VLR does not support Call Deflection, processing continues from the "Yes" exit of the test "Result=Aborted?".

Sheet 3, sheet 4: the procedure CCBS_ICH_Handle_UDUB is specific to CCBS; it is specified in GSM 03.93.

Sheet 4: the test "NDUB?" is executed only if the VLR supports CCBS. If the VLR does not support CCBS, processing continues from connector 5.

Sheet 5: the procedure CCBS_ICH_Set_CCBS_Target is specific to CCBS; it is specified in GSM 03.93.

Sheet 5: the procedure Handle_CFNRc is specified in subclause.

Sheet 6: the procedure Forward_CUG_Check is specific to CUG; it is specified in subclause. If the VLR does not support CUG, processing continues from the "Yes" exit of the test "Result=Call allowed?".

	D Editorial modification	<input type="checkbox"/>		Release 99	<input checked="" type="checkbox"/>
			Release 00	<input type="checkbox"/>	

Reason for change: Regarding the stage1 specification for Multicall, we studied the necessity of additional data. It should be possible for the number of active calls supported simultaneously to be restricted by user subscription. The user subscription of the maximum number is stored in HLR, and sent to VLR when the Update Location procedure is raised.

Clauses affected:

16 8 Mobility services

17 8.8 Subscriber management services

18 8.8.1 MAP-INSERT-SUBSCRIBER-DATA service

19 8.8.1.1 Definition

20 This service is used by an HLR to update a VLR with certain subscriber data in the following occasions:

- 21 - the operator has changed the subscription of one or more supplementary services, basic services or data of a
- 22 subscriber. Note that in case of withdrawal of a Basic or Supplementary service this primitive shall not be used;
- 23 - the operator has applied, changed or removed Operator Determined Barring;
- 24 - the subscriber has changed data concerning one or more supplementary services by using a subscriber procedure;

25 - the HLR provides the VLR with subscriber parameters at location updating of a subscriber or at restoration. In
 26 this case, this service is used to indicate explicitly that a supplementary service is not provisioned, if the
 27 supplementary service specification requires it. The only supplementary services which have this requirement are
 28 the CLIR and COLR services. Network access mode is provided only in restoration.

29 Also this service is used by an HLR to update a SGSN with certain subscriber data in the following occasions:

- 30 - if the GPRS subscription has changed;
- 31 - if the network access mode is changed;
- 32 - the operator has applied, changed or removed Operator Determined Barring;
- 33 - the HLR provides the SGSN with subscriber parameters at GPRS location updating of a subscriber.

34 It is a confirmed service and consists of the primitives shown in table 6.8/1.

35 8.8.1.2 Service primitives

37

38 8.8.1.3 Parameter use

39 Network access mode

40 This parameter defines if the subscriber has access to MSC/VLR and/or to SGSN. This parameter is used by SGSN and
41 MSC/VLR. In VLR, the parameter is used only as part of Restore Data Procedure and the parameter is not stored in the
42 VLR.

43 All parameters are described in subclause 7.6. The following clarifications are applicable:

44 IMSI

45 It is only included if the service is not used in an ongoing transaction (e.g. location updating). This parameter is used by
46 the VLR and the SGSN.

47 MSISDN

48 It is included either at location updating or when it is changed. The MSISDN sent shall be the basic MSISDN. This
49 parameter is used by the VLR and the SGSN.

50 Category

51 It is included either at location updating or when it is changed. This parameter is used only by the VLR and if the SGSN
52 receives this parameter it shall ignore it.

53 Subscriber Status

54 It is included either at location updating or when it is changed.

55 To apply, remove or update Operator Determined Barring Categories the Subscriber Status is set to Operator
56 Determined Barring. In this case ODB General Data shall also be present. If the Operator Determined Barring applies
57 and the subscriber is registered in the HPLMN and HPLMN specific Operator Determined Barring applies then ODB
58 HPLMN Specific Data shall also be present.

59 To remove all Operator Determined Barring Categories the Subscriber Status shall be set to "Service Granted". This
60 parameter is used by the VLR and the SGSN.

61 Bearer service List

62 A list of Extensible Bearer service parameters (Extensible Bearer service is defined in subclause 7.6). An Extensible
63 Bearer service parameter must be the code for an individual Bearer service, except in the cases described below.

64 The codes for the Bearer service groups "allAlternateSpeech-DataCDA" and "allAlternateSpeech-DataCDS" shall, if
65 applicable, be sent from the HLR to the VLR as a pair. The codes for the Bearer service groups
66 "allSpeechFollowedByDataCDA" and "allSpeechFollowedByDataCDS" shall, if applicable, be sent from the HLR to
67 the VLR as a pair.

68 If it is included in the Request/Indication, it includes either all Extensible Bearer services subscribed (at location
69 updating or at restoration) or only the ones added (at subscriber data modification).

70 If the VLR receives an Indication containing any Extensible Bearer service parameters which it does not
71 support/allocate it returns them in the response to the HLR and discards the unsupported Extensible Bearer services (no
72 error is sent back), except in the cases described below.

73 If the VLR receives the codes for the Bearer service groups "allSpeechFollowedByDataCDA" and
74 "allSpeechFollowedByDataCDS" and supports one or more of the circuit-switched synchronous or asynchronous data
75 rates specified for simple data bearer services, it shall accept the bearer service codes, and not return them in the
76 response to the HLR. If the VLR does not support any of the circuit-switched synchronous or asynchronous data rates
77 specified for simple data bearer services, and receives the pair of codes for "allAlternateSpeech-DataCDA" and
78 "allAlternateSpeech-DataCDS" or the pair of codes for "allSpeechFollowedByDataCDA" and
79 "allSpeechFollowedByDataCDS", it shall reject the pair of codes by returning them in the response to the HLR. This
80 parameter is used only by the VLR and if the SGSN receives this parameter it shall ignore it.

81 Teleservice List

82 A list of Extensible Teleservice parameters (Extensible Teleservice is defined in subclause 7.6). An Extensible
83 Teleservice parameter must be the code for an individual Teleservice.

84 If it is included in the Request/Indication, it contains either all Extensible Teleservices subscribed (at location updating
85 or at restoration) or the ones added (at subscriber data modification). Only the Extensible Teleservices that are relevant
86 to the node at which the message is received should be included in the Teleservice List.

87 If the VLR or the SGSN receives an Indication containing any Extensible Teleservice parameters which it does not
88 support/allocate it returns them in the response to the HLR and discards the unsupported Extensible Teleservices (no
89 error is sent back). This parameter is used by the VLR and the SGSN.

90 Forwarding information List

91 A list of Extensible Forwarding information parameters (Extensible Forwarding information is defined in subclause 7.6).
92 It includes Call Forwarding services either at location updating or at restoration or when they are changed. Each
93 Extensible Forwarding information parameter shall be treated independently of all other parameters in the primitive.

94 The Extensible Forwarding information shall include the SS-Code for an individual call forwarding supplementary
95 service. The Extensible Forwarding information shall contain one or more Extensible Forwarding Features (Extensible
96 Forwarding Feature is defined in subclause 7.6).

97 The Extensible Forwarding Feature may include an Extensible Basic Service Group. This shall be interpreted according
98 to the rules in subclause 8.8.1.4.

99 The Extensible Forwarding Feature shall contain an Extensible SS-Status parameter.

100 If the Extensible SS-Status indicates that call forwarding is registered then (except for call forwarding unconditional) the
101 Extensible Forwarding Feature shall contain a forwarded-to number and, if available, the forwarded-to subaddress. In
102 other states the forwarded-to number and, if applicable, the forwarded-to subaddress shall not be included. For call
103 forwarding unconditional the forwarded-to number and, if applicable, the forwarded-to subaddress shall not be included.
104 If the VLR does not receive a forwarded-to subaddress then it shall assume that a forwarded-to subaddress has not been
105 registered.

106 The Extensible Forwarding Feature shall contain the extensible forwarding options (except for call forwarding
107 unconditional where the extensible forwarding options shall not be included). Bits 3 and 4 of the extensible forwarding
108 options shall be ignored by the VLR, and may be set to any value by the HLR.

109 For call forwarding on no reply: If the extensible SS-Status indicates that call forwarding is registered then the
110 Extensible Forwarding Feature shall contain an extensible no reply condition timer. In other states the no reply condition
111 timer shall not be included.

112 For call forwarding services other than call forwarding on no reply: The Extensible Forwarding Feature shall not contain
113 a no reply condition timer.

114 If the VLR receives an Indication containing any Call Forwarding service codes which it does not support/allocate it
115 returns them to the HLR in the parameter SS-Code List and discards the unsupported Call Forwarding service codes (no
116 error is sent back). This parameter is used only by the VLR and if the SGSN receives this parameter it shall ignore it.

117 Call barring information List

118 A list of Extensible Call barring information parameters (Extensible Call barring information is defined in
119 subclause 7.6). It includes Call Barring services either at location updating or at restoration or when they are changed.
120 Each Extensible Call barring information parameter shall be treated independently of all other parameters in the
121 primitive.

122 The Extensible Call barring information shall include the SS-Code for an individual call barring supplementary service.
123 The Extensible Call barring information shall contain one or more Extensible Call Barring Features (Extensible Call
124 Barring Feature is defined in subclause 7.6).

125 The Extensible Call Barring Feature may include an Extensible Basic Service Group. This shall be interpreted according
126 to the rules in subclause 8.8.1.4.

127 The Extensible Call Barring Feature shall contain an extensible SS-Status parameter.

128 If the VLR receives an Indication containing any Extensible Call Barring service codes which it does not
129 support/allocate it returns them to the HLR in the parameter SS-Code List and discards the unsupported Extensible Call
130 Barring service codes (no error is sent back). This parameter is used only by the VLR and if the SGSN receives this
131 parameter it shall ignore it.

132 CUG information List

133 A list of CUG information list parameters (CUG information is defined in subclause 7.6). It includes CUG information
134 either at location updating or at restoration or when it is changed.

135 At location updating, restoration or when there is a change in CUG data, the HLR shall include the complete CUG-
136 SubscriptionList and, if there are options per basic group, it shall also include the complete CUG-FeatureList. If there
137 are not options per extensible basic service group the CUG-FeatureList shall not be included.

138 In any dialogue, the first insertSubscriberData message which contains CUG information shall include a non-empty
139 CUG-SubscriptionList.

140 When the VLR receives CUG data it shall replace the stored CUG data with the received data set.

141 If CUG-FeatureList is omitted in the Insert Subscriber Data operation VLR shall interpret that no options per extensible
142 basic service group exist, and then it shall apply the default values i.e. no outgoing access, no incoming access, no
143 preferential CUG exists.

144 If CUG-Feature is received without preferential CUG, the VLR shall interpret that no preferential CUG applies.

145 If the VLR detects that there is overlapping in the information received within a dialogue, it shall send the error
146 Unexpected Data Value.

147 Note that data consistency between CUG subscription data and CUG feature data is the responsibility of the HLR.

148 If the VLR does not support the CUG service it returns its code to the HLR in the parameter SS-Code List and discards
149 the received information (no error is sent back). This parameter is used only by the VLR and if the SGSN receives this
150 parameter it shall ignore it.

151 SS-Data List

152 A list of Extensible SS-Data parameters (Extensible SS-Data is defined in subclause 7.6). It is sent for any other
153 supplementary service than Call Forwarding, Call Barring, CUG and eMLPP either at location updating or at
154 restoration or when they are changed. Each SS-Data parameter shall be treated independently of all other parameters in
155 the primitive.

156 The Extensible SS-Data shall include the SS-Code for an individual supplementary service.

157 The Extensible SS-Data shall contain an Extensible SS-Status parameter and any subscription options that are applicable
158 to the service defined by the SS-Code.

159 The SS-Data may include a Basic Service Group List. This shall be interpreted according to the rules in
160 subclause 8.8.1.4.

161 If the VLR receives an Indication containing any supplementary service codes which it does not support/allocate it
162 returns them to the HLR in the parameter SS-Code List and therefore discards the unsupported service codes received
163 (no error is sent back). This parameter is used only by the VLR and if the SGSN receives this parameter it shall ignore
164 it.

165 Operator Determined Barring General data

166 If it is included in a Request/Indication, it includes all the Operator Determined Barring categories that may be applied
167 to a subscriber registered in any PLMN. This parameter is only included in a Request/Indication when the parameter
168 Subscriber Status is set to the value Operator Determined Barring. Note that all General Operator Determined Barring
169 Categories shall be set to their actual status.

170 If the VLR or the SGSN receives an Indication containing Operator Determined Barring General Data which shows that
171 the subscriber is subject to barring not supported / not allocated by the VLR or by the SGSN, it returns Operator
172 Determined Barring General Data in the response to the HLR to show the barring categories which are not supported /
173 not allocated by the VLR or by the SGSN. This parameter is used by the VLR and the SGSN.

174 Operator Determined Barring HPLMN data

175 It includes all the Operator Determined Barring categories that may be applied only to a subscriber registered in the
176 HPLMN. Therefore, it shall only be transferred to the VLR or to the SGSN when the subscriber is roaming into the
177 HPLMN and when the parameter Subscriber Status is set to the value Operator Determined Barring. Note that all
178 HPLMN Operator Determined Barring Categories shall be set to their actual status.

179 If Subscriber Status is set to the value Operator Determined Barring and no Operator Determined Barring HPLMN data
180 is present then the VLR or the SGSN shall not apply any HPLMN specific ODB services to the subscriber. This
181 parameter is used by the VLR and the SGSN.

182 eMLPP Subscription Data

183 If included in the Insert Subscriber Data request this parameter defines the priorities the subscriber might apply for a call
184 (as defined in subclause 7.6). It contains both subparameters of eMLPP.

185 If the VLR does not support the eMLPP service it returns its code to the HLR in the parameter SS-Code List and
186 therefore discards the received information (no error is sent back).

187 eMLPP subscription data that have been stored previously in a subscriber data record in the VLR are completely
188 replaced by the new eMLPP subscription data received in a MAP_INSERT_SUBSCRIBER_DATA during either an
189 Update Location or Restore Data procedure or a stand alone Insert Subscriber data procedure. This parameter is used
190 only by the VLR and if the SGSN receives this parameter it shall ignore it.

191 Roaming Restriction Due To Unsupported Feature

192 The HLR may decide to include this parameter in the request if certain services or features are indicated as not
193 supported by the MSC/VLR (e.g. Advice of Charge Charging Level).

194 If this parameter is sent to the VLR the MSC area is restricted by the HLR and the VLR. This parameter is used only by
195 the VLR and if the SGSN receives this parameter it shall ignore it.

196 Regional Subscription Data

197 If included in the Insert Subscriber Data request this parameter defines the subscriber's subscription area for the
198 addressed VLR or for the addressed SGSN (as defined in subclause 7.6). It contains the complete list of up to 10 Zone
199 Codes that apply to a subscriber in the currently visited PLMN. The HLR shall send only those Zone Codes which are
200 stored against the CC and NDC of the VLR or the CC and NDC of the SGSN to be updated.

201 NOTE: Support of this parameter is a network operator option and it will not be sent to networks which do not
202 support Regional Subscription.

203 Regional subscription data that have been stored previously in a subscriber data record in the VLR or in the SGSN are
204 completely replaced by the regional subscription data received in an Insert Subscriber Data indication during either an
205 Update Location or Restore Data procedure or a stand alone Insert Subscriber data procedure.

206 After the regional subscription data are inserted the VLR or the SGSN shall derive whether its location areas are allowed
207 or not. If the whole MSC or SGSN area is restricted it will be reported to HLR by returning the Regional Subscription
208 Response.

209 The VLR or the SGSN returns a Regional Subscription Response indicating that a problem with the Zone Code has been
210 detected in one of the following cases:

- 211 - Too Many Zone Codes: more than 10 Zone Codes are to be stored in the VLR or in the SGSN;
- 212 - Regional Subscription Not Supported by the VLR or the SGSN;
- 213 - Zone Codes Conflict: the VLR or the SGSN detects that the zone codes indicate conflicting service permission
214 for a location area.

215 Zone codes which have no mapping to location areas shall be ignored.

216 If a sequence of MAP_INSERT_SUBSCRIBER_DATA services is used during a dialogue, Regional Subscription Data
217 shall be accepted only in one service. Regional Subscription Data received in a subsequent service shall be rejected with
218 the error Unexpected Data Value.

219 If Regional Subscription Data are not included in any MAP_INSERT_SUBSCRIBER_DATA service, there is no
220 restriction of roaming due to Regional Subscription. This parameter is used by the VLR and the SGSN.

221 Voice Broadcast Data

222 This parameter contains a list of group id's a user might have subscribed to; (VBS-Data is defined in subclause 7.6). It
223 includes VBS information either at location updating or at restoration or when it is changed.

224 At location updating, restoration or when there is a change in VBS data, the HLR shall include the complete VBS-Data.

225 When the VLR receives VBS-Data within a dialogue it shall replace the stored VBS-data with the received data set. All
226 subsequent VBS-dta received within this dialogue shall be interpreted as add-on data.

227 If VBS-data is omitted in the Insert Subscriber Data operation the VLR shall keep the previously stored VBS data.

228 If the VLR detects that there is overlapping in the information received within a dialogue, it shall send the error
229 Unexpected Data Value. . This parameter is used only by the VLR and if the SGSN receives this parameter it shall
230 ignore it.

231 Voice Group Call Data

232 This parameter contains a list of group id's a user might have subscribed to; see subclause 7.6.

233 At location updating, restoration or when there is a change in VGCS data, the HLR shall include the complete VGCS-
234 Data.

235 When the VLR receives VGCS-Data within a dialogue it shall replace the stored VGCS-Data with the received data set.
236 All VGCS-Data received within this dialogue shall be interpreted as add-on data.

237 If VBCS-Data is omitted in the Insert Subscriber Data operation the VLR shall keep the previously stored VGCS-Data.

238 If the VLR detects that there is overlapping in the information received within a dialogue, it shall send the error
239 Unexpected Data Value. This parameter is used only by the VLR and if the SGSN receives this parameter it shall ignore
240 it.

241 North American Equal Access preferred Carrier Id List

242 A list of the preferred carrier identity codes that are subscribed to.

243 When the VLR receives this parameter from the HLR, it shall replace the previously stored preferred carrier identity
244 codes with the received ones. It is not possible to delete all the preferred carrier identity codes from the VLR using this
245 service. To delete all the preferred carrier identity codes from the VLR, the HLR shall use the
246 MAP_CANCEL_LOCATION service.

247 LSA Information

248 If included in the ISD request, this parameter contains a list of localised service area identities a user might have
249 subscribed to together with the priority of each localised service area; see subclause 7.6. The access right outside these
250 localised service areas is also indicated. In all cases mentioned below, the LSA information shall only include LSA Data
251 applicable to the VPLMN where the Subscriber is located. The VLR number, received in the MAP-
252 UPDATE_LOCATION primitive, or the SGSN number, received in the MAP_UPDATE_GPRS_LOCATION
253 primitive, can be used, alongside data stored in the HLR, to determine the LSA Data applicable to the VPLMN.

254 At restoration, location updating or GPRS location updating the HLR shall include the complete set of applicable LSA
255 Information.

256 When there is a change in LSA data the HLR shall include at least the new and/or modified LSA data.

257 When there is a change in the access right outside the localised service areas the HLR shall include the LSA only access
258 indicator.

259 When the SGSN or the VLR receives LSA information within a dialogue it shall check if the received data has to be
260 considered as the entire LSA information. If so, it shall replace the stored LSA information with the received data set,
261 otherwise it shall replace the data only for the modified LSA data (if any) and/or access right, and add the new LSA data
262 (if any) to the stored LSA Information.

263 If the entire LSA information is received, it shall always include the LSA only access indicator value together with the
264 LSA data applicable for the PLMN (if any).

265 If LSA Information is omitted in the Insert Subscriber Data operation the SGSN or the VLR shall keep the previously
266 stored LSA Information.

267 If the SGSN or the VLR detects that there is overlapping in the information received within a dialogue, it shall send the
268 error Unexpected Data Value. This parameter is used by the VLR and the SGSN.

269 LMU Identifier

270 This parameter indicates the presence of an LMU.

271 LCS Information

272 This parameter provides the following LCS related information for an MS subscriber:

273 - list of GMLCs in the HPLMN

274 - privacy exception list

275 Maximum Call Number

276 This parameter indicates the maximum number of active calls supported simultaneously. It is included either at location
277 updating or when it is changed. This parameter is used by the VLR.

278 SS-Code List

279 The list of SS-Code parameters that are provided to a subscriber but are not supported/allocated by the VLR (SS-Code
280 is defined in subclause 7.6). The list can only include individual SS-Codes that were sent in the service request. This
281 parameter is used only by the VLR.

282 Regional Subscription Response

283 If included in the response this parameter indicates one of:

284 - MSC Area Restricted entirely because of regional subscription;

285 - SGSN Area Restricted entirely because of regional subscription;

286 - Too Many Zone Codes to be inserted;

287 - Zone Codes Conflict;

288 - Regional Subscription not Supported by the VLR or by the SGSN.

289 If the VLR determines after insertion of Regional Subscription Data that the entire MSC area is restricted, the VLR shall
290 respond with a Regional Subscription Response indicating MSC Area Restricted. Otherwise MSC Area Restricted is not
291 sent. The HLR shall check whether the current MSC area is no longer restricted.

292 If the SGSN determines after insertion of Regional Subscription Data that the entire SGSN area is restricted, the SGSN
293 shall respond with a Regional Subscription Response indicating SGSN Area Restricted. Otherwise SGSN Area
294 Restricted is not sent. The HLR shall check whether the current SGSN area is no longer restricted. This parameter is
295 used by the VLR and by the SGSN.

296 VLR CAMEL Subscription Info

297 This parameter is sent for subscribers who have CAMEL services which are invoked in the MSC. In CAMEL phase 1
298 this parameter contains only the O-CSI. In CAMEL Phase 2 this parameter contains the SS-CSI and/or the O-CSI. The
299 VLR CAMEL Subscription Info is sent at location updating or when any information in the applicable CAMEL
300 Subscription Info in the HLR has been changed. The entire set of CAMEL Subscription Info is sent. If a set of CAMEL
301 Subscription Info is already stored in the VLR it is replaced by the received data. This parameter is used only by the
302 VLR and if the SGSN receives this parameter it shall ignore it.

303 The VLR CAMEL Subscription Info may contain the TIF-CSI (Translation Information Flag). See GSM 03.72 for the
304 use of this parameter and the conditions for its presence.

305 Supported CAMEL Phases

306 The use of this parameter and the requirements for its presence are specified in GSM 03.78. This parameter is used only
307 by the VLR.

308 GPRS Subscription Data

309 This parameter contains a list of PDP-contexts a user has subscribed to; see subclause 7.6.

310 At GPRS location updating the HLR shall include the complete GPRS Subscription Data.

311 When there is a change in GPRS subscriber data the HLR shall include only the new and/or modified PDP contexts.

312 When the SGSN receives GPRS Subscription Data within a dialogue it shall check if the received data has to be
313 considered as the entire GPRS subscription data. If so, it shall replace the stored GPRS Subscription Data with the
314 received data set, otherwise it shall replace the data only for the modified PDP contexts (if any) and add the new PDP
315 contexts (if any) to the stored GPRS Subscription Data.

316 If GPRS Subscription Data is omitted in the Insert Subscriber Data operation the SGSN shall keep the previously stored
317 GPRS Subscription Data.

318 If the SGSN detects that there is overlapping in the information received within a dialogue, it shall send the error
319 Unexpected Data Value. This parameter is used only by the SGSN and if the VLR receives this parameter it shall ignore
320 it.

321 Roaming Restricted In SGSN Due To Unsupported Feature

322 The HLR may decide to include this parameter in the request if certain services or features are indicated as not
323 supported by the SGSN. This parameter is used only by the SGSN and if the VLR receives this parameter it shall ignore
324 it.

325 User error

326 Only one of the following values is applicable:

- 327 - Unidentified subscriber;
- 328 - Data missing;
- 329 - Unexpected data value.

330 **8.8.1.4 Basic service information related to supplementary services**

331 A number of parameters that relate to supplementary services can be qualified by a Basic Service Group (or a Basic
332 Service Group List). This subclause explains how this information is to be interpreted. Supplementary service
333 parameters to which this subclause is applicable only apply to the basic service groups described in this subclause, and
334 only those basic service groups shall be overwritten at the VLR.

335 The Basic Service Group (or Basic Service Group List) is optional.

336 If present the Basic Service Group (or the elements of the Basic Service Group List) shall be one of:

- 337 - an Elementary Basic Service Group for which the supplementary service is applicable to at least one basic
338 service in the group; and to which the subscriber has a subscription to at least one basic service in the group;
- 339 - the group "All Teleservices" provided that the service is applicable to at least one teleservice and that the
340 subscriber has a subscription to at least one teleservice that is in the same Elementary Basic Service Group as a
341 teleservice to which the service is applicable;
- 342 - the group "All Bearer Services" provided that the service is applicable to at least one bearer service and that the
343 subscriber has a subscription to at least one bearer service that is in the same Elementary Basic Service Group as
344 a basic service to which the service is applicable.

345 If the Basic Service Group (or Basic Service Group List) is not present then the parameter shall apply to all Basic
346 Service Groups.

347 If the basic service information is not a single Elementary Basic Service Group then the parameter shall be taken as
348 applying individually to all the Elementary Basic Service Groups for which:

349 - the supplementary service is applicable to at least one basic service in the Basic Service Group; and

350 - the subscriber has a subscription to at least one basic service in the Basic Service Group.

351 The VLR is not required to store supplementary services data for Basic Service Groups that are not supported at the
352 VLR.

353 ****** Next Modified Section ******

354 **17 Abstract syntax of the MAP protocol**
