Title: Proposal on User Interaction in Monitoring
Agenda item: 5

User Interaction in the monitoring state was introduced as a part of call party handling which had originally been proposed to be included in the CAMEL phase 3 release 99. After N2 decided to drop CPH functionality from the release 99, this item was left remained.

At the last N2A meeting in Sofia Antipolis, some contributions were submitted to realise this feature. However, the technical realisation was outstanding from the unified view of call party handling. Also in the email discussion, no compromise has been reached whether the announcement is given to a single party or both parties.

Siemens does not oppose the feature of User Interaction in the monitoring state however, this feature would most preferable to be in line with CPH which is foreseen to be in the release 2000. If the current CRs were accepted, the alignment work for the release 2000 would be unavoidable work. Therefore Siemens strongly proposes to the following items.

- No User Interaction in the monitoring state in the release 99
- Send information to SA of CN's decision that this item may be completed uniformly with CPH.
