Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project, Technical Specification Group RAN.

The contents of this TS may be subject to continuing work within the 3GPP and may change following formal TSG approval. Should the TSG modify the contents of this TS, it will be re-released with an identifying change of release date and an increase in version number as follows:

Version m.t.e

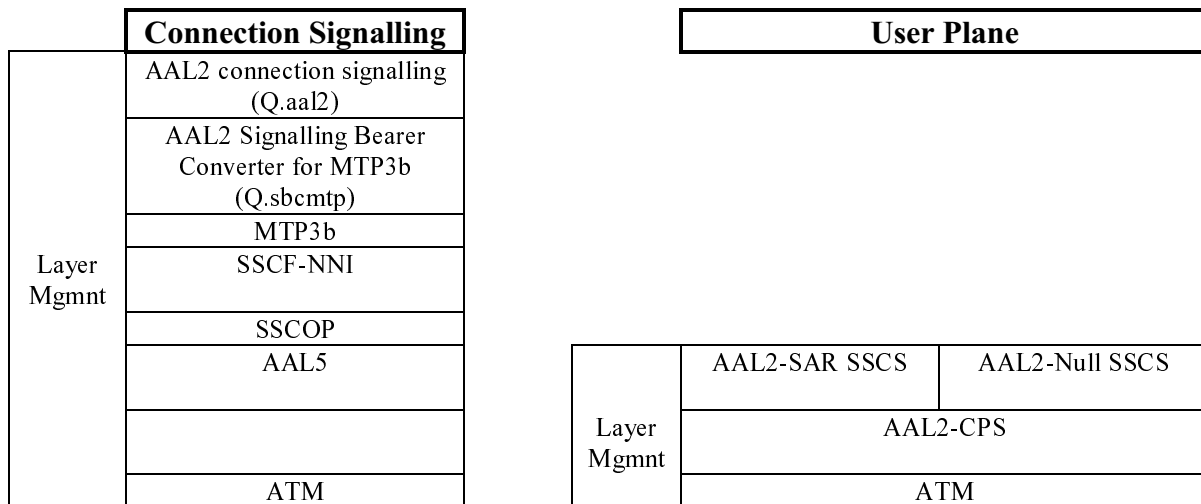

where:

- m indicates [major version number]
- x the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- y the third digit is incremented when editorial only changes have been incorporated into the specification.

Introduction

lu interface towards the PSTN/ISDN Domain

Data is transported over ATM Adaptation Layer 2 (AAL2) connections. An AAL2 connection is required for each Radio Access Bearer established.

lu interface towards the IP Domain

Multiple flows are multiplexed over an ATM virtual circuit within ATM Adaptation Layer 5 data units.

Scope

The present document specifies the standards for user data transport protocols and related signalling protocols to establish user plane transport bearers. It provides a summary of the protocols contained in the ITU Recommendations and their usage in the UTRAN. This includes the usage of the optional aspects of the protocol and how the protocol is

applied in the UTRAN. In the event of any differences between the content of this specification and the corresponding ITU Recommendations, the Recommendations take precedence.

References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.
- A non-specific reference to an ETS shall also be taken to refer to later versions published as an EN with the same number.

Definitions, symbols and abbreviations

Definitions

Symbols

Abbreviations

For the purposes of the present document, the following abbreviations apply:

- ATM Asynchronous Transfer Mode
- AAL ATM Adaptation Layer
- CPS Common Part Sublayer
- SBC Signalling Bearer Converter
- SSCS Service Specific Convergence Sublayer
-

[provide high level description of primitives and parameters, what options are necessary, any extensions required to support UTRAN application and information about how it is used particularly for the UTRAN application]

ATM Layer (I.361)

The ATM layer is based on I.361.

PSTN/ISDN domain

User plane transport layer

ATM Adaptation Layer 2

AAL2-specification (I.363.2)

Description

AAL2 provides the ability to multiplex variable length minicells within an ATM cell. The AAL2 connections can be established dynamically using Q.aal2 signalling.

Primitives and parameters

Primitive	Parameters
CPS-UNITDATA request	CPS-interface Data CPS-user to user indication
CPS-UNITDATA indication	CPS-interface Data CPS-user to user indication

Table 1: Primitives between CPS and SSCS

Primitive	Parameters
MAAL-UNITDATA request	CPS-interface Data CPS-user to user indication CPS Channel Identifier
MAAL-UNITDATA indication	CPS-interface Data CPS-user to user indication CPS-Channel identifier

Table 2: Primitives between CPS and Layer Management

CPS packet fields
Channel ID
Length Indicator
User to user indication

Table 4: CPS PDU header fields

AAL2-CPS Procedures

The UTRAN shall comply with the procedures specified in section 10 of I.363.2.

AAL2-Segmentation and Reassembly Service Specific Convergence Sublayer (I.366.1)

Allows packet size of more than the maximum length specified in the CPS. This allows the multiplexing with low rate and shorter packets for delay sensitive applications.

The following capabilities are provided:

- Segmentation and Reassembly
- Optional transmission error detection
- Optional assured data transfer.

ALCAP

Signaling protocol

AAL2 Signalling Protocol (Q.aal2)

The AAL type 2 signalling protocol provides the signalling capability to establish, release, and maintain AAL2 point-to-point connections across a series of ATM connections that carry AAL2 links.

Signaling bearer converter

AAL2 MTP3B SBC (Q.sbcmtp)

The AAL type 2 MTP3b signalling bearer converter allows the AAL2 signalling protocol to be used over the broadband MTP specified in Q.2210. The services and functions provided are:

- Independence from the underlying transmission media.
- Transparency of the transferred information.
- Data transfer service availability reporting to the SBC user.
- Congestion reporting to the SBC user.

IP domain

User data transport

IP

ATM Adaptation Layer 5 (I.363.5)
