3GPP TSG-RAN Working Group 1 (Radio L1) Stockholm, Sweden, 21 - 24 November 2000

Source: TSG-RAN WG1

To: TSG-RAN WG2

Title: Modification to the UE capability in TR 25.926 for Release 4.

Contact: Jussi Kahtava

jussi.kahtava@nokia.com

TSG RAN WG1 discussed the UE capability updates for Rel'4 and provides attached the first identified change with respect to the DSCH support for the radio access bearer combinations. The proposed change has been noted to cause very minor (if any) added complexity for the impacted reference UE radio access bearer capability combination from the physical layer point of view and thus has been agreed in WG1. TSG RAN WG1 kindly asks TSG RAN WG2 to modify the TR 25.926 accordingly.

Adiitionally, TSG RAN WG1 will provide further input for Release 4 TR 25.926 on the topics such as 1.28 Mcps TDD or DPCCH gating once the details on those topics have been finalised in TSG RAN WG1.

5.2 Reference UE radio access capability combinations

Based on required UE radio access capabilities to support reference RABs as defined in clause 6, this clause lists reference UE Radio Access capability combinations. Subclause 5.2.1 defines reference combinations of UE radio access capability parameters common for UL and DL. Subclause 5.2.2 and 5.2.3 define reference combinations of UE radio access capability parameters that are separate for DL and UL respectively. A reference combination for common UL and DL parameters, one combination for UL parameters and one combination for DL parameters together relate to a UE with a certain implementation complexity, that allows support for one or several combined reference RABs. Combinations for UL and DL can be chosen independently. The bit rate supported by the selected combination of common UL and DL parameters needs to be at least as high as the maximum out of the supported bit rates of the selected combination of DL parameters and the selected combination of UL parameters. Different combinations have different levels of implementation complexity.

For defined reference RABs, it is possible to require a UE to meet a certain reference UE radio access capability combination. Each UE needs to have capabilities complying with a given reference radio access capability combination. Each individual radio access capability parameter as defined in Subclause 5.1 shall be signalled.

The reference combination numbers shall not be used in the signalling of UE radio access capabilities between the UE and UTRAN. Reference UE radio access capability combinations provide default configurations that should be used as a basis for conformance testing against reference RABs.

Allowed values of UE capability parameters are limited by the defined range and granularity of values in Subclause 5.1. Values might change depending on further definition of reference RABs for testing.

5.2.1 Combinations of common UE Radio Access Parameters for UL and DL

NOTE: It is FFS whether measurement-related capabilities need to be included in the combinations. These capabilities are independent from the supported RABs.

Table 5.2.1.1: UE radio access capability parameter combinations, parameters common for UL and DL

| Reference combination of UE Radio Access capability parameters common for UL and DL | 32kbps class | 64kbps class | 128kbps class | 384kbps class | 768kbps class | 2048kbps class | | |
|---|---|------------------|------------------|------------------|------------------|-------------------|--|--|
| PDCP parameters | | | | | | | | |
