Foreword

1 Scope

This document establishes the minimum RF characteristics of the FDD mode of UTRA for the User Equipment (UE).

2 References

The following documents contain provisions, which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, subsequent revisions do apply.

A non-specific reference to an ETS shall also be taken to refer to later versions published as an EN with the same number.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the following definitions apply:

Power Setting	The value of the control signal, which determines the desired transmitter, output Power. Typically, the power setting would be altered in response to power control commands
Maximum Power Setting	The highest value of the Power control setting which can be used.
Maximum output Power	This refers to the measure of power when averaged over the transmit timeslot at the maximum power setting.
Peak Power	The instantaneous power of the RF envelope which is not expected to be exceeded for [99.9%] of the time
Maximum peak power	The peak power observed when operating at a given maximum output power.
Average transmit power	The average transmitter output power obtained over any specified time interval, including periods with no transmission.
Maximum average power	The average transmitter output power obtained over any specified time interval, including periods with no transmission, when the transmit time slots are at the maximum power setting.

3.2 Symbols

For the purposes of the present document, the following symbols apply:
<symbol> <Explanation>

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

ACIR	Adjacent Channel Interference Ratio
ACLR	Adjacent Channel Leakage power Ratio
ACS	Adjacent Channel Selectivity
BS	Base Station
BER	Bit Error Rate
CW	Continuous Wave (unmodulated signal)
DTX	
DL	Down Link (forward link)
EIRP	Effective Isotropic Radiated Power
FDD	Frequency Division Duplexing
FER	Frame Error Rate
MER	Message Error Rate
PPM	Parts Per Million
RSSI	Received Signal Strength Indicator
SIR	Signal to Interference Ratio
TDD	Time Division Duplexing
TPC	Transmit Power Control
UE	User Equipment
UL	Up Link (reverse link)
UTRA	UMTS Terrestrial Radio Access

Chip Rate	Chip rate of W-CDMA system, equals to 4.096 M chips per second.
CPCH	Common Physical Channel.
$CPCH\_E_c$	Average energy per PN chip for CPCH.
$Data\_E_c$	Average energy per PN chip for the DATA fields in the DPCH.
$Data\ \frac{E_c}{I_o}$	The ratio of the received energy per PN chip for the DATA fields of the DPCH to the total received power spectral density at the UE antenna connector.
$\frac{Data\_E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for the DATA fields of the DPCH to the total transmit power spectral density.
DPCH	Dedicated Physical Channel
$DPCH\_E_c$	Average energy per PN chip for DPCH.
$\frac{DPCH\_E_c}{I_{or}}$	The ratio of the received energy per PN chip of the DPCH to the total received power spectral density at the UE antenna connector.
DTCH	Dedicated Traffic Channel, which is mapped into Dedicated Physical Channel. DTCH contains the user data.
E_b	Average energy per information bit for the Perch Channel, DPCH CPCH, PCH, and for FACH at the UE antenna connector.
$\frac{E_b}{N_t}$	The ratio of combined received energy per information bit to the effective noise power spectral density for the Perch Channel, DPCH CPCH, PCH, and for the FACH at the UE antenna connector. Following items are calculated as overhead: pilot, TPC, RI, CRC, tail, repetition, convolution coding and Turbo coding.
E_c	Average energy per PN chip.
$\frac{E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for different fields or physical channels to the total transmit power spectral density.
FACH	Forward Access Channel

Information Data Rate	Rate of the user information, which must be transmitted over the Air Interface. For example, output rate of the voice codec.
I_o	The total received power spectral density, including signal and interference, as measured at the UE antenna connector.
I_{oc}	The power spectral density of a band limited white noise source (simulating interference from other cells) as measured at the UE antenna connector.
I_{or}	The total transmit power spectral density of the Forward link at the base station antenna connector.
$\hat{I}_{or}$	The received power spectral density of the Forward link as measured at the UE antenna connector.
ISCP	Given only interference is received, the average power of the received signal after despreading to the code and combining. Equivalent to the RSCP value but now only interference is received instead of signal.
N_t	The effective noise power spectral density at the UE antenna connector.
OCNS	Orthogonal Channel Noise Simulator, a mechanism used to simulate the users or control signals on the other orthogonal channels of a Forward link.
$OCNS\_E_c$	Average energy per PN chip for the OCNS.
$\frac{OCNS\_E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for the OCNS to the total transmit power spectral density.
PCH	Paging Channel
$Perch\ \frac{E_c}{I_o}$	The ratio of the received Perch Channel energy per chip to the total received power spectral density at the UE antenna connector.
$\frac{Perch\_E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for the Perch Channel to the total transmit power spectral density.
$Pilot\_E_c$	Average energy per PN chip for the Pilot field in the DPCH.
$Pilot\ \frac{E_c}{I_o}$	The ratio of the received energy per PN chip for the Pilot field of the DPCH to the total received power spectral density at the UE antenna connector.
$\frac{Pilot\_E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for the Pilot field of the DPCH to the total transmit power spectral density.
RI_E_c	Average energy per PN chip for the Rate Information field in the DPCH.
$RI\ \frac{E_c}{I_o}$	The ratio of the received energy per PN chip for the Rate Information field of the DPCH to the total received power spectral density at the UE antenna connector.
$\frac{RI\_E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for the Rate Information field of the DPCH to the total transmit power spectral density.
RSCP	Given only signal power is received, the average power of the received signal after despreading and combining
TPC_E_c	Average energy per PN chip for the Transmission Power Control field in the DPCH.
$TPC\ \frac{E_c}{I_o}$	The ratio of the received energy per PN chip for the Transmission Power Control field of the DPCH to the total received power spectral density at the UE antenna connector.
$\frac{TPC\_E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for the Transmission Power Control field of the DPCH to the total transmit power spectral density.

3.4 CDMA Equations

The equations listed below describe the relationship between various parameters under different conditions.

3.4.1 BS Transmission Power

Transmit power of the Base Station is normalized to 1 and can be presented as

$$\frac{Perch\_E_c}{I_{or}}+\frac{Pilot\_E_c}{I_{or}}+\frac{TPC\_E_c}{I_{or}}+\frac{RI\_E_c}{I_{or}}+\frac{DATA\_E_c}{I_{or}}+\frac{CPCH\_E_c}{I_{or}}+\frac{OCNS\_E_c}{I_{or}}=1.$$

Dedicated Physical Channel consists of four different fields. Therefore, it can be shown that

$$\frac{DPCH\_E_c}{I_{or}}=\frac{Pilot\_E_c}{I_{or}}+\frac{TPC\_E_c}{I_{or}}+\frac{RI\_E_c}{I_{or}}+\frac{DATA\_E_c}{I_{or}}.$$

Hence, transmit power of Base Station can be presented also as

$$\frac{Perch\_E_c}{I_{or}}+\frac{DPCH\_E_c}{I_{or}}+\frac{CPCH\_E_c}{I_{or}}+\frac{OCNS\_E_c}{I_{or}}=1$$

.

3.4.2 Rx Signal Strength for UE Not in Handoff (non-fading Channel)

For Perch channel we get

$$Perch\ \frac{E_c}{I_o}=\frac{\dfrac{Perch\_E_c}{I_{or}}}{\dfrac{I_{oc}}{\hat{I}_{or}}+1}$$

and for a Dedicated Physical Channel

$$DPCH\ \frac{E_c}{I_o}=\frac{\dfrac{DPCH\_E_c}{I_{or}}}{\dfrac{I_{oc}}{\hat{I}_{or}}+1}.$$

For the Common Physical Channel we get

$$CPCH\ \frac{E_c}{I_o}=\frac{\dfrac{CPCH\_E_c}{I_{or}}}{\dfrac{I_{oc}}{\hat{I}_{or}}+1}.$$

E_b/N_t for the Perch channel is given as

$$Perch\ \frac{E_b}{N_t}=\frac{\dfrac{Perch\_E_c}{I_{or}}\times\dfrac{Chip\ Rate}{Information\ Data\ Rate}}{\dfrac{I_{oc}}{\hat{I}_{or}}}.$$

The same for Dedicated Traffic Channels is given as

$$DTCH\ \frac{E_b}{N_t}=\frac{\dfrac{DPCH\_E_c}{I_{or}}\times\dfrac{Chip\ Rate}{Information\ Data\ Rate}}{\dfrac{I_{oc}}{\hat{I}_{or}}},$$

Similar equations can be derived for the Paging Channel and for the Forward Access Channel. For the Paging Channel we get

$$PCH\ \frac{E_b}{N_t}=\frac{\dfrac{CPCH\_E_c}{I_{or}}\times\dfrac{Chip\ Rate}{Paging\ Data\ Rate}}{\dfrac{I_{oc}}{\hat{I}_{or}}},$$

and the same for FACH is given as

$$FACH\ \frac{E_b}{N_t}=\frac{\dfrac{CPCH\_E_c}{I_{or}}\times\dfrac{Chip\ Rate}{Control\ Data\ Rate}}{\dfrac{I_{oc}}{\hat{I}_{or}}}.$$

3.4.3 Rx Strength for UE Not in Handoff (Non-fading Channel)

Let us assume that the sum of the channel tap powers is equal to one in multi-path channel with L taps, i.e.,

$$\sum_{i=1}^{L} a_i^2 = 1 ,$$

where a_i represent the complex channel coefficient of the tap i. When assuming that a receiver combines all the multi-paths E_b/N_t for Perch channel is given as

$$Perch\ \frac{E_b}{N_t} = \frac{Perch\_E_c}{I_{or}} \times \frac{Chip\ Rate}{Information\ Data\ Rate} \times \sum_{i=1}^{L} \frac{a_i^2}{\frac{I_{oc}}{\hat{I}_{or}} + \left(1 - a_i^2\right)} .$$

As an example E_b/N_t for Perch channel in Indoor channel is

$$Perch\ \frac{E_b}{N_t} = \frac{Perch\_E_c}{I_{or}} \times \frac{Chip\ Rate}{Information\ Data\ Rate} \times \left(\frac{0.900824}{\frac{I_{oc}}{\hat{I}_{or}} + 0.099176} + \frac{0.098773}{\frac{I_{oc}}{\hat{I}_{or}} + 0.901227} + \frac{0.000402}{\frac{I_{oc}}{\hat{I}_{or}} + 0.999598} \right).$$

Using the same assumptions, E_b/N_t for Dedicated Traffic Channels is given as

$$DTCH\ \frac{E_b}{N_t} = \frac{DPCH\_E_c}{I_{or}} \times \frac{Chip\ Rate}{Information\ Data\ Rate} \times \sum_{i=1}^{L} \frac{a_i^2}{\frac{I_{oc}}{\hat{I}_{or}} + \left(1 - a_i^2\right)} .$$

3.4.4 Rx Signal Strength for UE in two-way Handover

When the received power from each cell is $\hat{I}_{or}$ we get for each Perch Channel

$$Perch\ \frac{E_c}{I_o} = \frac{\frac{Perch\_E_c}{I_{or}}}{\frac{I_{oc}}{\hat{I}_{or}} + 2} .$$

If the power received from cell 1 and cell 2 are $\hat{I}_{or1}$ and $\hat{I}_{or2}$, respectively, then

$$Perch\ \frac{E_c}{I_o}(Cell\ 1) = \frac{\frac{Perch\_E_c}{I_{or1}}}{\frac{I_{oc}}{\hat{I}_{or1}} + \frac{\hat{I}_{or2}}{\hat{I}_{or1}} + 1}$$

and

$$Perch\ \frac{E_c}{I_o}(Cell\ 2) = \frac{\frac{Perch\_E_c}{I_{or2}}}{\frac{I_{oc}}{\hat{I}_{or2}} + \frac{\hat{I}_{or1}}{\hat{I}_{or2}} + 1} .$$

Similarly,

$$DTCH\ \frac{E_b}{N_t} = \frac{DPCH\_E_c}{I_{or}} \times \frac{Chip\ Rate}{Information\ Data\ Rate} \times \sum_{i=1}^{L} \frac{2a_i^2}{\frac{I_{oc}}{\hat{I}_{or}} + 1 + \left(1 - a_i^2\right)}$$

if the channel is non-static

.

4 General

4.1 Measurement uncertainty

The requirements given in this specification do not include measurement uncertainties related to conformance testing as used e.g. in regulatory testing or production testing. Conformance testing is specified in [reference to the appropriate document].

5 Frequency bands and channel arrangement

5.1 General

The information presented in this section is based on a chip rate of 4.096 Mcps.

Note
1. Other chip rates may be considered in future releases.

5.2 Frequency bands

UTRA/FDD is designed to operate in either of the following paired bands;

(a) 1920 – 1980MHz: Up-link (Mobile transmit, base receive)
2110 – 2170MHz: Down-link (Base transmit, mobile receive)

(b) [FFS; for deployment in ITU Region 2]

Deployment in other frequency bands is not precluded.

5.3 TX–RX frequency separation

(a) The minimum transmit to receive frequency separation is [134.8 MHz] and the maximum value is [245.2 MHz] when operating in the paired band defined in sub-clause 5.2 (a). A possible value is 190 MHz
(b) UTRA/FDD can support both fixed and variable transmit to receive frequency separation. [The specific limits are yet to be determined]
(c) The use of other transmit to receive frequency separations in other frequency bands shall not be precluded.

5.4 Channel arrangement

5.4.1 Channel spacing

The nominal channel spacing is 5 MHz, but this can be adjusted to optimize performance in a particular deployment scenario.

5.4.2 Channel raster

The channel raster is 200 kHz, which means that the carrier frequency must be a multiple of 200 kHz.

5.4.3 Channel number

The carrier frequency is designated by the UTRA Absolute Radio Frequency Channel Number (UARFCN)

6 Transmitter characteristics

6.1 General

Unless detailed the transmitter characteristic are specified at the antenna connector of the UE. For UE with integral antenna only, a reference antenna with a gain of 0 dBi is assumed. Transmitter characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

6.2 Transmit power

6.2.1 UE maximum output power

The following Power Classes define the maximum output power;

Table 1:UE Power Classes

Power Class	Maximum output power	Tolerance
1	+33 dBm	± [2] dB
2	+27 dBm	± [2] dB
3	+24 dBm	± [2] dB
4	+21 dBm	± 2 dB

Note

1. The maximum output power refers to the measure of power when averaged over the transmit slot at the maximum power control setting.
2. The tolerance of the maximum output power is below the prescribed value even for the multi-code transmission mode
3. For UE using directive antennas for transmission, a class dependent limit will be placed on the maximum Effective Isotropic Radiated Power (EIRP).

6.3 Frequency stability

The UE modulated carrier frequency shall be accurate to within ±0.1 PPM compared to carrier frequency received from the BS. These signals will have an apparent error due to BS frequency error and Doppler shift. In the later case, signals from the BS must be averaged over sufficient time that errors due to noise or interference are allowed for within the above ±0.1PPM figure.

Table 2: Frequency stability

AFC	Frequency stability
ON	within ± 0.1 PPM

6.4 Output power dynamics

Power control is used to limit the interference level

6.4.1 Open loop power control

Open loop power control is the ability of the UE transmitter to sets its output power to a specific value. The UE open loop power control tolerance is given in Table 3

Table 3: Open loop power control

Normal conditions	± 9 dB
Extreme conditions	± 12 dB

6.4.2 Closed loop power control

Closed loop power control in the Uplink is the ability of the UE transmitter to adjust its output power in accordance with the TPC symbols received in the downlink.

Closed loop power control in the downlink is the ability of the UE receiver to estimate the received SIR, compare it with the SIR target and transmit the TPC symbols in accordance to the results of this comparison.

6.4.2.1 Closed loop power control in the downlink

6.4.2.1.1 Minimum requirements

(a) The downlink tolerance for the SIR measurements shall be within the range shown in Table 4
(b) The dynamic range of the SIR measurement of the received signal in the downlink shall be better than shown in Table 4
(c) The transmitted TPC symbols must respond to a change in the received SIR within the time period specified in Table 4

Table 4: Downlink closed loop power control

SIR measured tolerance	[ ] dB
SIR dynamic range	[ ] dB
Time constant for $SIRt_{sig}$	[0.625] ms

6.4.3 Power control steps

The power control step is the minimum step change in the UL- transmitter output power in response to a TPC message.

6.4.3.1 Minimum requirement

The UE transmitter shall have the capability of setting the closed loop output power with a step size of 1 dB.
(a) The tolerance of the transmitter output power due to closed loop power control shall be within the range shown in Table 5.
(b) The average rate of change in mean power shall be greater than [8.0] dB per [10] slots and less than [12.0] dB per [10] slots
(c) Following the reception of a valid power control bit, the mean output power of the UE shall be within [0.3] dB of its final value in less than [62.5] us from the beginning of the next slot.

Table 5: Transmitter power control tolerance

TPC Symbol in the forward-link	Transmitter power control tolerance	
	Lower	Upper
11	+[0.5]dB	+[1.5]dB
00	-[0.5]dB	-[1.5]dB

6.4.4 Minimum transmit output power

The minimum controlled output power of the UE is when the power control setting is set to a minimum value. This is when both the closed loop and open loop power control indicate a minimum transmit output power is required.

6.4.4.1 Minimum requirement

The minimum transmit power shall be better than –44 dBm /4.096MHz

6.4.5 Power control cycles per second

The maximum rate of change for the UL/DL transmitter power control step.
Up link (UL) 1.6 kHz
Down link (DL) 1.6 kHz

6.5 Transmit ON/OFF power

6.5.1 Transmit OFF power

The transmit OFF power state is when the UE does not transmit except during UL DTX mode. This parameter is defined as the maximum output transmit power within the channel bandwidth when the transmitter is OFF.

6.5.1.1 Minimum requirement

The requirement for the transmit OFF power shall be better than –50 dBm /4.096 MHz

6.5.2 Transmit ON/OFF Time mask

The time mask for transmit ON/OFF defines the ramping time allowed for the UE between transmit OFF power and transmit ON power. Possible ON/OFF scenarios are RACH or UL slotted mode

6.5.2.1 Minimum requirement

The transmit power levels versus time should meet the mask specified in figure 1

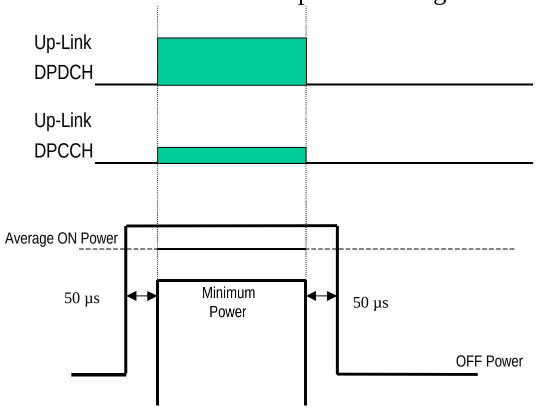

Figure 1: Transmit ON/OFF template

6.5.3 Transmit DTX

DTX is used to minimize the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present. Under DTX control, the DTX requirements is defined in terms of the transmitting power ratio and timing as follows:

(a) Both DPDCH and DPCCH transmission is ON in the up link.
(b) In case of no information after (a), DPDCH transmission is OFF
(c) In case synchronism is out of range after section (b), DPCCH transmission is OFF in up link.

6.5.3.1 Minimum requirement

The transmitting power ratio and the timing should be in the range indicated in figure 2

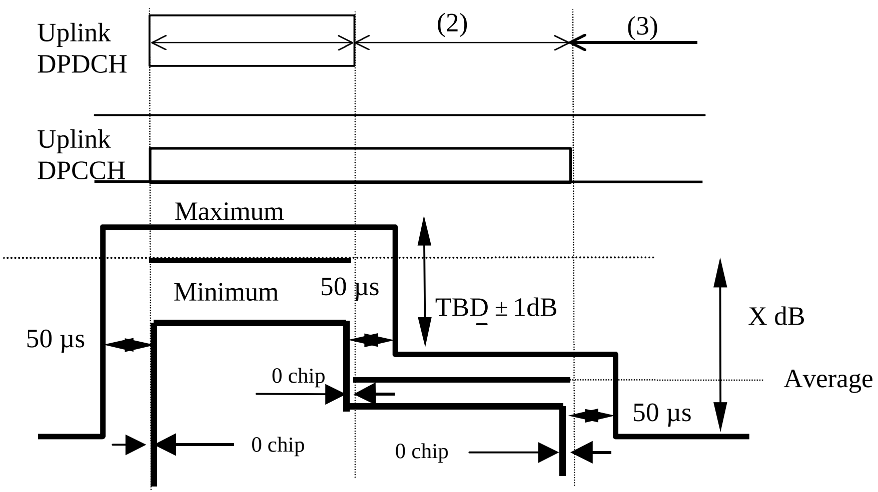

Figure 2; DTX template

6.6 Output RF spectrum emissions

6.6.1 Occupied bandwidth

Occupied bandwidth is a measure of the bandwidth containing 99% of the total integrated power of the transmitted spectrum, centered on the assigned channel frequency. The occupied channel bandwidth is less than 5 MHz based on a chip rate of 4.096 Mcps.

6.6.2 Out of band emission

Out of band emissions are unwanted emissions immediately outside the [channel] bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit can be specified in terms of a spectrum emission mask or adjacent channel power ratio for the transmitter.

6.6.2.1 Spectrum emission mask

The emission mask will be different for the type of UE(s) and may depend on the power class, single code, multi-code, allocation slotted mode, etc

6.6.2.2 Adjacent Channel Leakage power Ratio (ACLR)

Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the transmitted power to the power measured after a receiver filter in the adjacent channel(s). Both the transmitted power and the received power are measured with a filter response that is [normally rectangular] with a noise power bandwidth equal to the chip rate.

6.6.2.2.1 Minimum requirement

Table 6:UE ACLR

UE channel	ACLR limit
± First adjacent channel	[35] dB
± Second adjacent channel	[45] dB

Note

1. The ACLR due to switching transients shall not exceed the limits in table 6. To ensure that switching transients due to slotted or DTX mode does not degrade the ACLR value the reference measurement conditions are FFS
2. The possibility is being considered of dynamically relaxing the ACLR requirements for User Equipment(s) under conditions when this would not lead to significant interference (with respect to other system scenario or UMTS operators). This would be carried out under network control, primarily to facilitate reduction in UE power consumption.
3. The ACLR value is FFS based on system scenario and implementation issues.

6.6.3 Spurious emissions

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out of band emissions.

The frequency boundary and the detailed transitions of the limits between the requirement for out band emissions and spectrum emissions are based on ITU-R Recommendations SM.329.

6.6.3.1 Minimum requirement

Table 7a: Spurious emissions requirements

Frequency Bandwidth	Resolution Bandwidth	Minimum requirement
9kHz ≤ f < 150kHz	1 kHz	-36dBm
150kHz ≤ f < 30MHz	10 kHz	-36dBm
30MHz ≤ f < 1000 MHz	100kHz	-36dBm
1GHz ≤ f < 11GHz	1MHz	-30dBm

Table 7b: Spurious emissions regional requirements

Frequency Bandwidth	Resolution Bandwidth	Minimum requirement
1893.5 MHz < f < 1910 MHz	300 kHz	-40dBm

6.7 Transmit intermodulation

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

6.7.1 Minimum requirement

User Equipment(s) transmitting in close vicinity of each other can produce intermodulation products, which can fall into the UE, or BS receive band as an unwanted interfering signal. The UE intermodulation attenuation is defined by the ratio of the output power of the wanted signal to the output power of the intermodulation product when an interfering CW signal is added at a level below the wanted signal. The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in table 8

Table 8: Transmit Intermodulation

Interference Signal Frequency Offset	5MHz	10MHz
Interference CW Signal Level	-40dBc	
Minimum Requirement	-35dBc	-45dBc

6.8 Modulation Accuracy

The modulation accuracy is a measure of the difference between the measured waveform and the theoretical modulated waveform (the error vector). It is the square root of the ratio of the mean error vector power to the mean reference signal power expressed as a %. The measurement interval is one power control group (timeslot)

6.8.1 Minimum requirement

The modulation accuracy shall not exceed [17.5] % based on the test parameters detailed in table 9

Table 9: Modulation accuracy

Parameter	Level	Unit
Output power	[UE maximum power]	dBm
DPCCH/DPDCH	[-6 (*)]	dB
DPDCH physical channel	[64]	kbps
User bit rate	[12.2]	kbps
Power control	off	

Note

1. Measurement channel is based on mapping of a 12.2 kbps voice channel
2. * Power ratio will need to be defined in RAN WG1

6.8.2 Peak code Domain error

The code domain error is computed by projecting the error vector power onto the code domain at the maximum spreading factor. The error vector for each power code is defined as the ratio to the mean power of the reference waveform expressed in dB. The peak code domain error is defined as the maximum value for the code domain error. The measurement interval is one power control group (timeslot)

The requirement for peak code domain error is only applicable for multi-code transmission.

6.8.2.1 Minimum requirement

The peak code domain error shall not exceed [ ] dB

7.0 Receiver characteristics

7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. Receiver characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

7.2 Diversity characteristics

A suitable receiver structure using coherent reception in both channel impulse response estimation and code tracking procedures is assumed. Three forms of diversity are considered to be available in UTRA/FDD:

Table 10: Diversity characteristics for UTRA/FDD

Time diversity	Channel coding and interleaving in both up link and down link
Multi-path diversity	Rake receiver or other suitable receiver structure with maximum combining. Additional processing elements can increase the delay-spread performance due to increased capture of signal energy.
Antenna diversity	Antenna diversity with maximum ratio combing in the base station and optionally in the mobile stations. Possibility for downlink transmit diversity in the base station.

7.3 Static reference sensitivity level

The static reference sensitivity is the minimum receiver input power measured at the antenna port at which the Bit Error Rate (BER) does not exceed a specific value

7.3.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in table 11

Table 11: Test parameters for static reference sensitivity

Parameter	**Level**	**Unit**
$\frac{Perch\_Ec}{I_{or}}$	[-1]	dB
$\frac{DPCH\_Ec}{I_{or}}$	[-7 (*)]	dB
$\hat{I}_{or}$	[-110]	dBm/4.096 MHz
User bit rate	[12.2]	kbps
Channel symbol rate	[32]	ksps
Rate information	On	

Note
1. Measurement channel is based on mapping of a 12.2 kbps voice channel

7.4 Maximum input level

This is defined as the maximum receiver input power at the UE antenna port which does not degrade the specified BER performance.

7.4.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in table 12

Table 12: Maximum input power

Parameter	**Level**	**Unit**
User bit rate	[12.2]	kbps
Channel symbol rate	[32]	ksps
$\frac{Perch\_Ec}{I_{or}}$	[-10]	dB
$\frac{DPCH\_Ec}{I_{or}}$	[-19]	dB
$\frac{OCNS\_Ec}{I_{or}}$	[-0.52]	dB
$\hat{I}_{or}$	[-25]	dBm/4.096MHz
Rate Information	on	

Note
1. Since the spreading factor is large (10log(SF)=21dB), the majority of the total input signal consists of the OCNS interference. <Change OCNS definition>
2. Measurement channel is based on mapping of a 12.2 kbps voice channel

7.5 Adjacent Channel Selectivity (ACS)

Adjacent Channel Selectivity (ACS) is a measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the center frequency of the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

7.5.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in table 13

Table 13: Adjacent Channel Selectivity

Parameter	**Level**	**Unit**
User bit rate	[12.2]	kbps
Channel symbol rate	[32]	ksps
$\frac{Perch\_Ec}{I_{or}}$	[-1]	dB
$\frac{DPCH\_Ec}{I_{or}}$	[-7]	dB
$\hat{I}_{or}$	[-93]	dBm/4.096MHz
I_{oac}	[-52]	dBm/4.096MHz
Fuw	[5]	MHz

Note
1. *Measurement channel is based on mapping of a 12.2 kbps voice channel

7.6 Blocking characteristics

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

7.6.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in table 14 and table 15

Table 14: In-band blocking

Parameter	**Level**	**Unit**
User bit rate	[12.2]	Kbps

Rate Information	On	On	

7.7 Spurious response

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the blocking limit is not met. <Only applies to out of band text required>

The static reference performance as specified in clause [ ] should be met when the following signals are applied to the receiver;

1. A wanted signal at the assigned channel frequency, 3 dB above the static reference level.
2. A CW interfering signal below a level of [ ] dBm.
3. The number of allowed spurious responses is an item for further study.

7.7.1 Minimum requirement

TBD

7.8 Intermodulation characteristics

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receiver a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

7.8.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in table 16.

Table 16: Receive intermodulation characteristics

Parameter	Level	Unit
User bit rate	[12.2]	kbps
Channel symbol rate	[32]	ksps
$\frac{Perch\_Ec}{I_{or}}$	[-1]	dB
$\frac{DPCH\_Ec}{I_{or}}$	[-7 (*)]	dB
$\hat{I}_{or}$	[-107]	dBm/4.096MHz
I_{ouw1}	[-46]	dBm
I_{ouw2}	[-46]	dBm/4.096MHz
Fuw1 (CW)	[10]	MHz
Fuw2 (Modulated)	[20]	MHz
Rate Information	[On]	

Note: Measurement channel is based on mapping of a 12.2 kbps voice channel.

7.9 Spurious emissions

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector.

7.9.1 Minimum requirement

The spurious emission shall be:

(a) Less than -60dBm/4.096 MHz at the UE antenna connector, for frequencies within the UE receive band.
(b) Less than -57dBm/100 kHz at the UE antenna connector, for frequencies band from 9kHz to 1GHz.
(c) Less than -47dBm/100 kHz at the UE antenna connector, for frequencies band from 1GHz to 12.75 GHz.

8 Performance requirement

8.1 General

Performance requirements are specified for a number of test environments and multi-path channels

8.1.1 Test Environments

The UE is specified in a number of different environments i.e., static, indoor, outdoor to indoor and pedestrian, and vehicular environments. Each of these environments is modeled by typical channel models that are defined Annex B

The UE shall be able to receive a number of different channels transmitted from the BS. These channels may have different bit rates and different BER/FER requirements. Table 17 describes the UE test environment.

Table 17: UE test environment

8.2 Dynamic reference sensitivity performance

The minimum required dynamic reference sensitivity performance is specified according to the traffic rate and the propagation conditions.

8.2.1 Demodulation in non fading Channel

8.2.1.1 Demodulation of Paging Channel

The receive characteristics of the paging channel in the non-fading environment is determined by the Paging message error rate (MER). MER is measured at the data rate specified for the paging channel.

The UE sleep mode has an upper limit after which it must up wake up and demodulate the paging channel and associated paging messages.

Note

1. Definition of paging channel
2. Definition of MER

8.2.1.1.1 Minimum requirement

(a) The actual $PCH\ \ E_b/N_t$ shall be within ± 0.2 dB of the value indicated in Table 18

(b) The MER shall not exceed the piece-wise linear MER curve specified by the points Table 19

Table 18 Paging channel in a non fading channel

TBD	TBD

8.2.2.2 Demodulation of Forward Access Channel

The receive characteristics of the Forward Access Channel (FACH) in the non fading environment are determined by the average message error rate (MER). MER is measured at data rate specified for FACH.

8.2.2.2.1 Minimum requirement

(a) The actual $FACH \quad E_b/N_t$ shall be within ± 0.2 dB of the value indicated in table 20

(b) The MER shall not exceed the piece-wise linear MER curve specified by the points in table 21

TBD	TBD
TBD	TBD

8.2.2.3 Demodulation of Dedicated Traffic Channel

The receive characteristic of the Dedicated Traffic Channel (DTCH) in the non fading environment is determined by the average bit error rate (BER). BER is specified for each individual data rate of the DTCH. DTCH is mapped into the Dedicated Physical Channel (DPCH).

8.2.3.3.1 Minimum requirement

(a) The actual $DTCH \quad E_b/N_t$ used in the test shall be within ± 0.2 dB of the value indicated in table 22 and table 23

(b) The BER shall not exceed the piece-wise linear BER curve specified by the points in table 23

8.3 Demodulation of DTCH in Multi-path Fading Channel

8.3.1 Single Link Performance

The receive characteristics of the Dedicated Traffic Channel (DTCH) in different multi-path fading environments are determined by the average bit error rate (BER) values. BER is measured for the each of the individual data rate specified for the DPCH. DTCH is mapped into in Dedicated Physical Channel (DPCH).

8.3.1.1 Minimum requirement

(a) The actual $DTCH \quad E_b/N_t$ used shall be within ± 0.2 dB of the value indicated in Table 25,Table 26, Table 27and Table 28.

(b) The BER shall not exceed the piece-wise linear BER curve specified by the points in Table 29, Table 30 and Table 31

8.4 Inter-Cell Soft Handover Performance

The bit error rate characteristics of UE is determined during an inter-cell soft handover. During the soft handover a UE receives signals from different Base Stations. A UE has to be able to demodulate two Perch channels and to combine the energy of DTCH channels. Delay profiles of signals received from different Base Stations are assumed to be the same but time shifted by 2440 ns (10 chips).

The receive characteristics of the different channels during inter-cell handover are determined by the average bit error rate (BER) values.

8.4.1 Minimum requirement

(a) The actual $DTCH \quad E_b/N_t$ used in the test shall be within ± 0.2 dB of the value indicated in Table 32

(b) The BER shall not exceed the piece-wise linear BER curve specified by the points in Table 33

Table 32: Test Parameters for DTCH Reception in a Multi-path Channel during a Soft Handoff (Vehicular Environment).

8.5 Rx synchronisation characterisitics

8.5.1 Synchronization Performance

8.5.1.1 Search of other Cells

Search for other cells is used to check whether the UE correctly searches and measures other BS(s) during the specified operation.

8.5.1.1.1 Minimum requirement

TBD

Table 34: Test Parameters for the Search of other Cells

Parameter	Unit	Channel 1		Channel 2	
		Time 1	Time 2	Time 1	Time 2
$Perch\ \frac{E_c}{I_{or}}$	dB

I_{oc}	dBm/4.096 MHz	-60			
$Perch\ \frac{E_c}{I_o}$	dB				

8.5.2 Inter-Frequency Handover

The UE has to have the ability to make an Inter-frequency handover. This type of handover can happen within BS or between two BS(s) Currently [ARIB Vol. 3] does not define requirements for Inter-frequency handover. <This item is FFS>.

8.5.2.1 Minimum requirement

TBD

8.6 Timing characteristics

8.6.1 Synchronization

The timing of the MS is determined during specified operation

8.6.1.1 Minimum requirement

TBD

8.6.2 Channel Timing Dependencies

The channel timing of the UE is determined during the specified operation. Relative timing between different code channels transmitted and received at the mobile station. This includes relative frame and slot timing requirements between the forward and reverse links, as well as among different channels.
Possible items to be covered are:

1. Long code timing offsets for each downlink physical channel
2. Requirements for accuracy

8.6.2.1 Minimum requirement

TBD

8.6.3 Reception Timing

The reception timing of the MS is determined during the specified operation.

8.6.3.1 Minimum requirement

TBD

Annex A (normative) Measurement channels

A.1 Voice service

Figure.A1 and figure A2 shows the channel coding of DL/UL Common measurement channel for voice services. The UL channel is based on a 32ksps DPCH including TFCI bits. The DL channel is based on a 64kbps DPDCH and 16kbps DPCCH. <Both the UL/DL channels coding will need to be revised in accordance with the decisions taken in other parts of 3GPP to accounts of changes to the physical channel structure, channel coding, codec, etc>

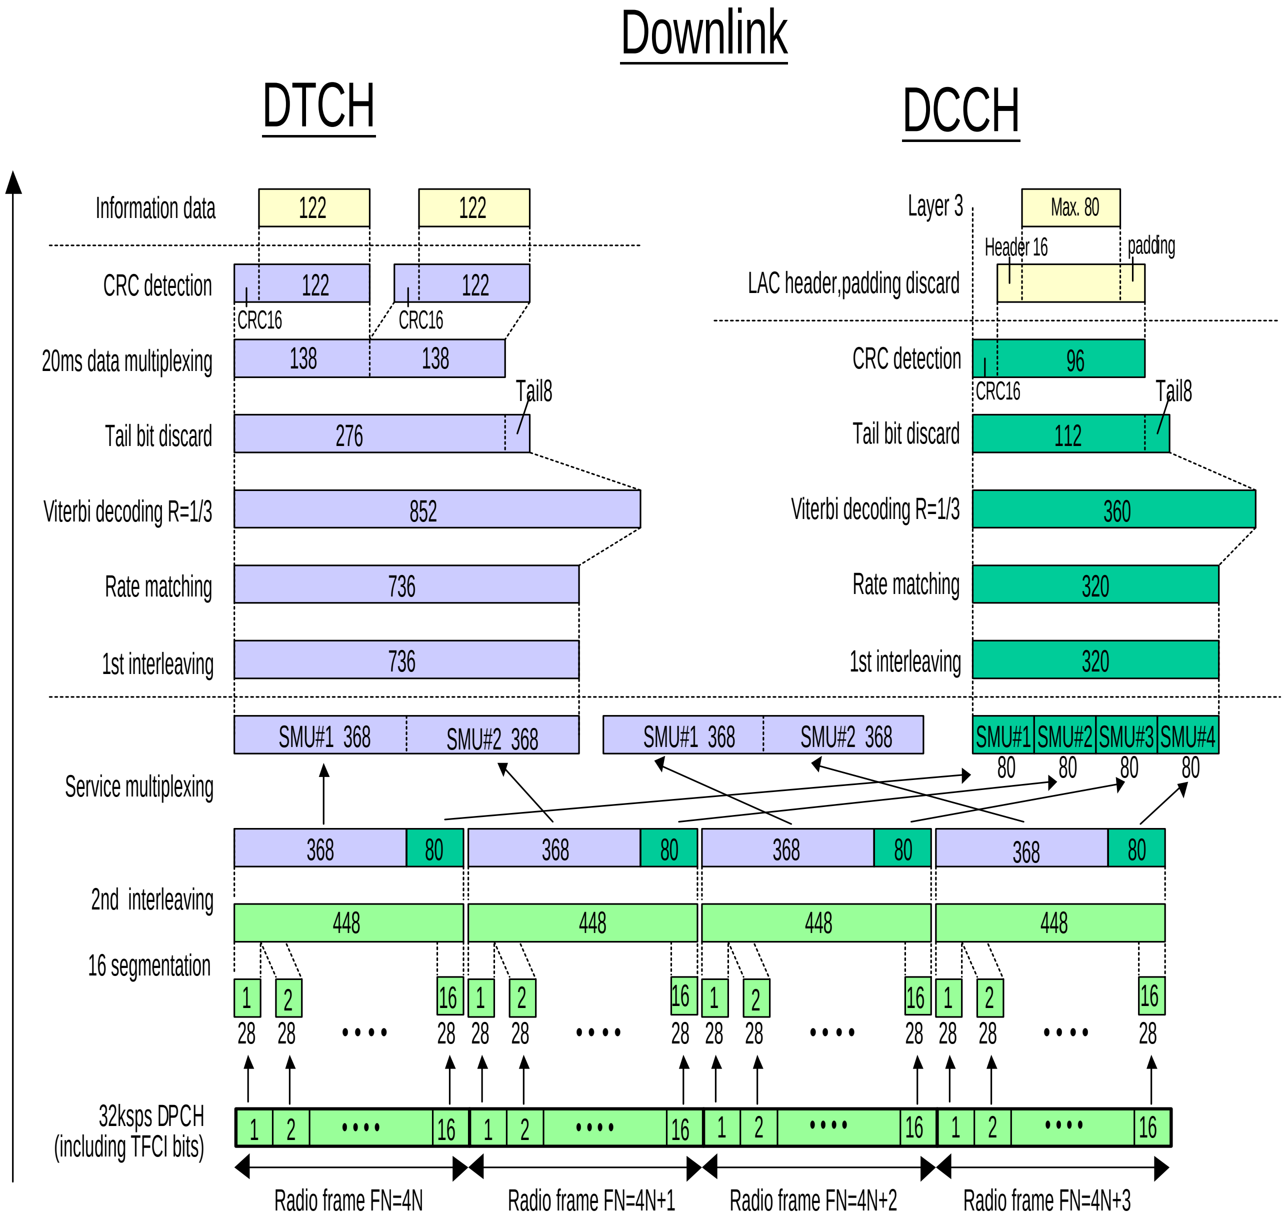

Figure A1: Channel coding of DL Common measurement channel

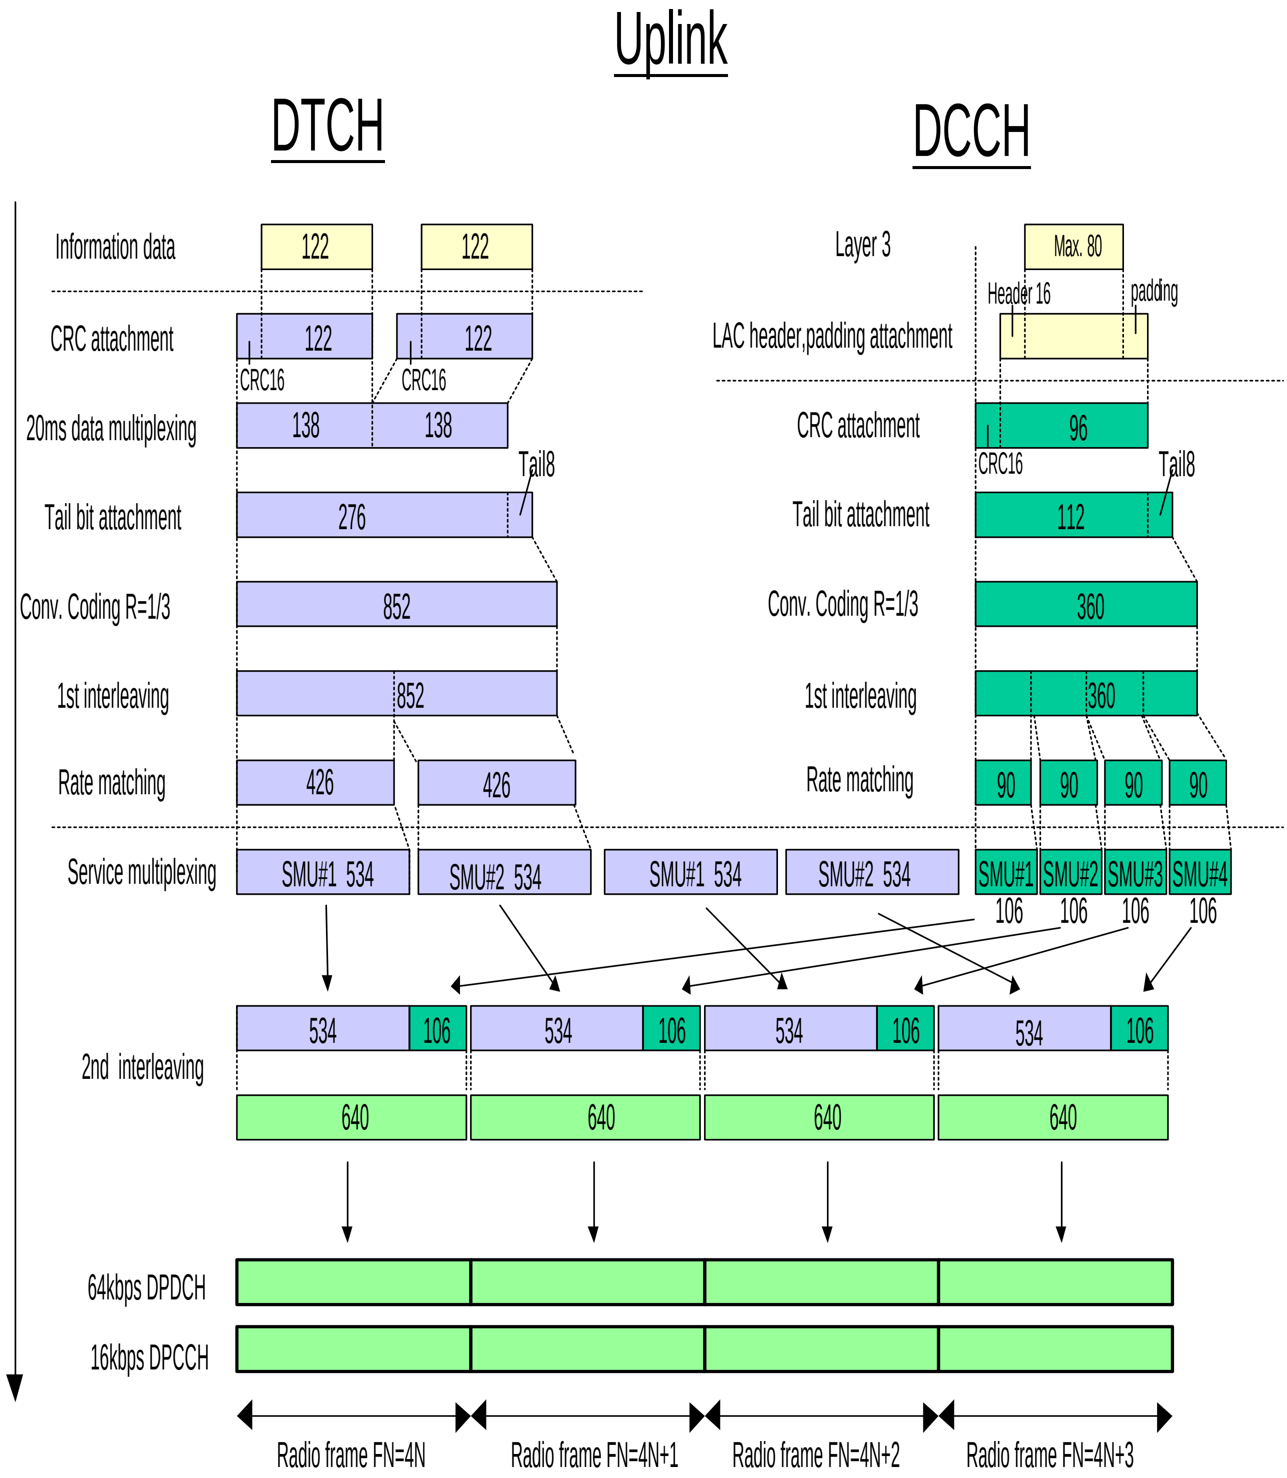

Figure A2: Channel coding of UL Common measurement channel

Annex B (normative): Propagation conditions

B.1 Test Environments

Each of these environments static, indoor, out-door to indoor and pedestrian, and vehicular environments. is modeled by typical channel models that are defined in this section

These channels may have different bit rates and different BER/FER requirements. Table B1 describes these requirements.

Table B1: Test Environments for UE Performance Specifications

B.2 Channel Models

The channel model for the non fading performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this channel model.

Modified ITU channel models[2] are used for the performance measurements in multi-path fading channels. The channel models for indoor, indoor to outdoor and pedestrian, and for vehicular environments are depicted in Table B2

Table B2: Channel Models for Non-Static Environments

Indoor		**Indoor to Outdoor and Pedestrian**		**Vehicular**

488	-33.5	488	-24.7	488	-6.5
				732	-9.4
				976	-12.7
				1220	-13.3
				1708	-15.4
				1952	-25.4

[2] These channel models are the same that were used in simulations and evaluations of the system presented in "Japan's Proposal for Candidate Radio Transmission Technology on IMT-2000, W-CDMA, June 1998"

Annex C (normative): Environmental conditions

C.1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of this specifications shall be fulfilled.

C.2 Environmental requirements

The requirements in this clause apply to all types of UE(s)

C.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:

[+15]°C to [+35]°C	for normal conditions (with relative humidity of 25 % to 75 %);
[-10]°C to [+55]°C	for small UE units extreme conditions (see IEC publications 68-2-1 and 68-2-2)
[-20]°C to [+55]°C	For other units extreme conditions (see IEC publications 68-2-1 and 68-2-2).

Outside this temperature range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in S4.01A for extreme operation.

C.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.

The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

Power source	**Lower extreme voltage**	**Higher extreme voltage**	**Normal conditions voltage**
AC mains	0,9 * nominal	1,1 * nominal	nominal
Regulated lead acid battery	0,9 * nominal	1,3 * nominal	1,1 * nominal
Non regulated batteries:			
- Leclanché / lithium	0,85 * nominal	Nominal	Nominal
- Mercury/nickel & cadmium	0,90 * nominal	Nominal	Nominal

Outside this voltage range the UE if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in S4.01A for extreme operation. In particular, the UE shall inhibit all RF transmissions when the power supply voltage is below the manufacturer declared shutdown voltage.

C.2.3 Vibration

The UE shall fulfil all the requirements when vibrated at the following frequency/amplitudes:

Frequency	**ASD (Acceleration Spectral Density) random vibration**
5 Hz to 20 Hz	0,96 m^2/s^3
20 Hz to 500 Hz	0,96 m^2/s^3 at 20 Hz, thereafter -3 dB/Octave

Outside the specified frequency range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in S4.01A for extreme operation
