
3GPP TSG-GERAN WG2 Meeting #14bis
San Diego, USA
19 – 23 May 2003

TD G2#14bis(03)0437
Agenda Item: 6

Title: LS on Stage 3 work for Early UE handling
Response to: LS on Stage 3 work for Early UE handling (G2-030379 / S2-032154)
Release: Release 5
Work Item: TEI

Source: GERAN2
To: SA2, CN4
Cc: CN1, RAN3, SA1, GERAN, RAN, SA, CN

Contact Person:
Name: José Luis CARRIZO MARTÍNEZ, Vodafone
Tel. Number: +44 1635 676093
E-mail Address: jose-luis.carrizo@gb.vodafone.co.uk

Attachments: None.

1. Overall Description:

GERAN2 would like to thank SA2 for their answers and guidance in the preparation of the stage 3 CRs to the GERAN specifications for 'early UE handling'.

GERAN2 would like to inform SA2 and the other groups addressed in this Liaison Statement that GERAN2 has agreed what is considered to be the minimum set of changes for the GERAN handling of 'early UEs'. These changes are restricted to the A interface and relate to the addition of a new cause for the failure of the handover to UMTS procedure. This cause enables the BSC not to attempt further handovers to UMTS for the mobile station involved. Furthermore, at external handover, the old BSC notifies the new BSC of the MS condition, so that further handovers to UMTS in the new BSC can be prevented for the mobile station in question. The stage 3 CR containing these changes (modifications to BSSAP in 3GPP TS 48.008) has been agreed by GERAN2 and it will be submitted for approval by TSG GERAN #15 at the end of June.

Regarding whether or not the BSC should receive and use the UESBI, GERAN2 has not concluded on this issue as yet and hence the agreed changes described above do not include it. It is GERAN2's understanding that this is consistent with the assumptions in CN4 and that CN4 will include in their specifications the addition of the UESBI on the MAP-E interface for the case of GERAN to UTRAN handover. However, this issue will be discussed again at the next GERAN2 meeting at the end of June, collocated with TSG GERAN #15. GERAN2 will notify SA2, CN1 and CN4 if these changes are agreed at the next GERAN2 meeting, so that these groups can change their affected specifications, if any.

2. Actions

No actions needed.

3. Date of Next TSG-GERAN WG2 Meetings:

TSG-GERAN WG2 Meeting #15	24 th – 26 th June 2003	Fort Lauderdale, USA
TSG-GERAN WG2 Meeting #16	26 th – 28 th August 2003	New York, USA
TSG-GERAN WG2 Meeting #16bis	6 th – 10 th October 2003	Porto, Portugal

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document defines the stage-2 description of the mechanism to provide the 3GPP network entities with UE Specific Behaviour Information (UESBI). UESBI may be used by correcting mechanisms to overcome some of the issues that have been recognized by 3GPP in TR 25.994 (Measures employed by the UMTS Radio Access Network (UTRAN) to overcome early User Equipment (UE) implementation faults) [13], and other such documents. The description of these correcting mechanisms is out of the scope of this TS.

ITU-T Recommendation I.130 [1] describes a three-stage method for characterisation of telecommunication services, and ITU-T Recommendation Q.65 [2] defines stage 2 of the method.

Editor's note: some text within this TS is dependent on future GERAN 2 and TSG RAN plenary decisions, as described below:

Text with this colour background (green?) in this TS is dependent upon the TSG RAN plenary decision on whether the BMUEF or IMEISV is sent on the Iu interface.

Text with this colour background (yellow?) in this TS is dependent upon a GERAN 2 decision on whether the transfer of UESBI-Iu is applicable on the A interface.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply.

PUESBINE Feature: is the functionality described by this TS.

UE Specific Behaviour Information - Uu (UESBI-Uu): is information that is sent using Access Stratum signalling from the UE to the RAN. It can be used to derive some specific information about the UE’s capabilities.

UE Specific Behaviour Information - Iu (UESBI-Iu): is information that is sent from the MSC and/or SGSN to the RAN that can be used to derive some specific information about the UE’s capabilities. **[The UESBI-Iu is the IMEISV.]**
[The UESBI-Iu is a Bit Map of UE Faults derived from the IMEISV.]

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

PUESBINE	Provision of UE Specific Behaviour Information to Network Entities
UESBI	UE Specific Behaviour Information
UESBI-Uu	UE Specific Behaviour Information - Uu
UESBI-Iu	UE Specific Behaviour Information - Iu

4 General Description

4.1 UESBI

Due to the potential problems that may happen in the standard or in its implementation by different types of UE, it may be needed to transfer to the RAN “information on the specific behavior of particular sets of UE” with regard to some 3GPP features. This aims at helping the infrastructure to handle UE(s) already in the field that are facing problems to support some 3GPP features. This “information on the specific behavior of particular sets of UE” is called UE Specific Behavior Information (UESBI).

UESBI actually corresponds to 2 different sets of information:

- UESBI-Uu which is sent from UE to RAN using signalling specified in the RRC protocol (TS 25.331 [6])
- UESBI-Iu which is sent by CN to UTRAN over the Iu interface and is derived from IMEISV retrieved by CN from UE.

UESBI-Uu and UESBI-Iu may have a different nature, their coding is defined in RRC and RANAP respectively, and have different handling within the network. Whether or not UESBI-Uu or UESBI-Iu is used to describe an interoperability issue will be determined on a case by case basis and all uses should be documented in TRs such as 25.994 [13] and 25.995 [14]. As a result of this process, RAN nodes should not receive conflicting information in UESBI-Uu and UESBI-Iu.

The SRNC uses both UESBI-Iu and UESBI-Uu to derive the specific behaviour of the UE.

4.2 UESBI-Uu

UESBI-Uu information is sent:

- (at RRC connection establishment from idle mode) directly by UE to Serving RNC at RRC connection establishment
- (at SRNS relocation) from Serving RNC to Target RNC in the RRC: SRNS RELOCATION INFO message carried through CN during SRNS relocation in the RANAP: *Source RNC to Target RNC Transparent Container IE*.
- (at RRC connection establishment for an UE coming from another Radio Access Technology e.g. in case of 2G to 3G Hand-Over) from UE to Serving RNC via “Inter RAT Hand-Over” Information. This “Inter RAT Hand-Over Information” is sent to the source RAN (e.g. BSS), and at handover copied by the source RAN into a transparent container that is carried through the CN towards the Target RNC.
- (at RR connection establishment) the UE can directly send the “Inter RAT Handover Information” which contains the UESBI-Uu to the GERAN BSS. However, if control of GERAN BSS functions using the UESBI-Uu is needed, then new functionality will be required within the BSS to decode the ASN.1 PER information contained in the Inter-RAT Handover Information IE.

4.3 UESBI-Iu

When the UE attaches to the VLR or SGSN or makes its first Location Update in the VLR, the IMEISV information is retrieved from the UE and stored in the VLR or SGSN.

At each subsequent Iu interface connection establishment (eg for a CS domain voice call or a PS domain data transfer), the IMEISV is retrieved from the VLR or from the MM context in the SGSN [and, the UESBI-Iu is derived]. The UESBI-Iu is then sent to the SRNC. The UESBI-Iu is normally sent in the Common Id procedure (the same procedure that currently carries the IMSI) or by the UESBI-Iu Information procedure. This is summarised in figure 4.3-1.

Figure 4.3-1: UESBI-Iu architecture

If the UE state is changed from RRC Connected to RRC Idle, all information derived from the received UESBI is released in the RNS. Thus if the UE state is changed afterwards back to RRC Connected the delivery of the UESBI-Iu from MSC or SGSN to SRNC shall be repeated.

At inter-SRNS relocation or at inter-system handover, the anchor MSC (and not the source RAN node) sends the UESBI-Iu to the target RAN node.

4.4 UESBI-Iu on A interface

With GERAN, usage of UESBI is currently aimed to only solve issues related to CS domain GERAN to UTRAN handover. To smooth rollout of features, a Handover Reject cause is defined to provide minimal functionality (see section 5.1.4.2).

[Whether transfer of the UESBI-Iu to the BSS is needed to permit more sophisticated functionality is not certain. Signalling flows in this TS do however show how UESBI-Iu can be delivered to the GERAN BSS across the A interface.]

It is anticipated that the need for the BSS to use UESBI-Iu is less than that for the RNC. Hence, the standards shall ensure that it is an implementation choice as to whether or not to transfer UESBI-Iu across the A interface.]

Note: Currently no study has been performed on any need to influence the GPRS Cell Change Order to UTRAN procedure.

5 Signalling Flows

5.1 UESBI-Uu Signalling Flows

5.1.1 RRC connection establishment (initial and at cell reselection towards UTRAN)

At RRC connection establishment from idle mode, UESBI-Uu information shall be sent directly by the UE to the Serving RNC. This is valid both for the cases where the UE initiates the contact with the network either from RRC idle mode or in the case of a cell reselection from GERAN to UTRAN.

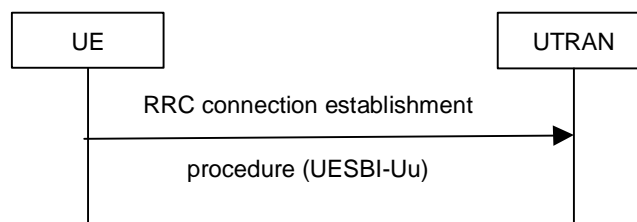

Figure 5.1.1-1: UESBI-Uu transfer at RRC Connection Establishment

The RRC Connection Establishment procedure is defined in TS 25.331 [6]

5.1.2 RR connection establishment

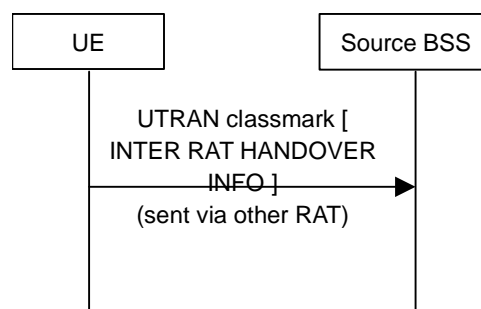

Figure 5.1.2-1: UESBI-Uu transfer at RR Connection Establishment

The UE sends the “Inter RAT Handover Information” which contains the UESBI-Uu to the GERAN BSS. Whether this information is sent immediately at RR connection establishment or this is delayed until just before inter-RAT handover is performed, is controlled by the BSS. Further information is given in TS 25.331 [6] and TS 44.018 [7].

5.1.3 SRNS Relocation

UESBI-Uu information is sent from the Serving RNC to the Target RNC in the RRC: SRNS RELOCATION INFO message (specified in 25.331 [6]) which is carried through the CN during SRNS relocation in the RANAP: *Source RNC to Target RNC Transparent Container IE* ([9]).

This transparent container is:

- put in the RANAP Relocation Required message sent by the Serving RNC to the CN,
- carried from source MSC/SGSN to target MSC/SGSN via E or Gn interface signalling in the case of inter MSC/SGSN SRNS relocation
- sent by the target MSC/SGSN in the RANAP Relocation Request message sent to target RNC.

5.1.4 Inter RAT Hand-over

5.1.4.1 3G → 2G inter RAT Hand-Over

If the UE fails to support properly this kind of Hand-Over, UTRAN can detect it through UESBI information already received from UE or CN, and react accordingly (e.g. avoid this kind of Hand-Over,...).

5.1.4.2 2G → 3G inter RAT Hand-Over

UESBI-Uu information is sent from UE to Serving RNC via “Inter RAT Hand-Over” Information transfer.

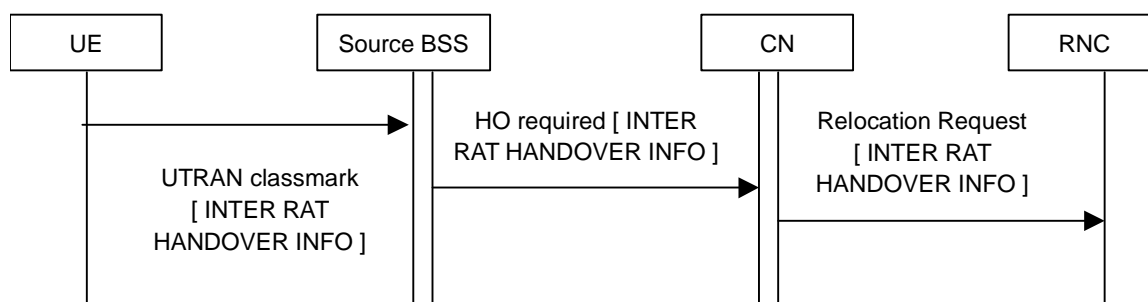

Figure 5.1.4.2-1 UESBI-Uu transfer at Inter RAT handover

The inter RAT handover information transfer procedure is used by the UE to convey RRC information needed for inter RAT handover to UTRAN. “Inter RAT Hand-Over Information” is prepared by the UE, then sent on the Radio Resource (RR) layer of the source RAT (e.g. RR for GSM) together with Radio classmark information. Further information is given in TS 25.331 [6] and TS 44.018 [7].

At 2G → 3G Hand-Over / SRNS relocation this information is transferred from source BSS to target RNC through the CN via the relevant BSS to RNC transparent containers defined in 48.008 [8] and 25.413 [9].

The target RNC shall use the UESBI-Uu to determine whether the handover can succeed.

In the case that the target RNC believes that the handover can succeed, the target RNC may use the UESBI-Uu to aid the handover procedure.

In the case that the UESBI-Uu indicates to the target RNC that the handover will fail, the target RNC shall reject the handover attempt. The target RNC shall use a specific cause value that causes the source BSS to not attempt further 2G to 3G handovers for that UE, and, causes the source BSS to take appropriate actions, eg to modify the set of neighbouring cells that the UE is measuring.

This requires that the GSM BSS shall include the Response Request IE in the Handover Required message.

Following an inter-BSS handover, the new BSS might attempt a GSM to UMTS handover that is doomed to failure. To avoid this the old BSS shall indicate to the new BSS whether or not the UE has had a handover to UMTS rejected by an RNC “because of the UESBI”.

5.2 UESBI-Iu Signalling Flows

5.2.1 CS Attach / Normal Location Update without Gs

5.2.1.1 Obtaining the IMEISV

In order for the UESBI-Iu functionality to perform satisfactorily, the CS domain shall indicate that IMSI Attach-Detach shall be applied in both 2G and 3G cells.

When the UE sends a Location Updating Request message to the MSC/VLR, then:

- a) if the Location Updating Type is set to 'IMSI attach', the MSC/VLR shall obtain the IMEISV from the UE ;
- b) if the Location Updating Type is set to 'Periodic updating', the MSC/VLR need not obtain the IMEISV from the UE;
- c) if the Location Updating Type is set to 'Normal Location Updating' then the MSC/VLR should obtain the IMEISV from the UE.

For case (c) above, the MSC/VLR shall obtain the IMEISV if the IMSI was not previously registered in the VLR. Optimisation of the MSC/VLR behaviour for case (c) is permitted in order to balance the signaling load caused by obtaining the IMEISV at every intra-MSC normal location update against the chances that the MSC/VLR does not discover IMEISV changes caused by the SIM being inserted into a new UE which then Location Updates to a new LA within the same MSC/VLR.

Note 1: If any mismatch between the UE's IMEISV and the IMEISV stored in the MSC/VLR leads to the user having problems, then the problems may be cleared by the user switching the UE off and back on, forcing a CS domain IMSI Attach to occur.

Note 2: any such optimisations should be re-evaluated if the Supercharger (see TS 23.116 [12]) or Intra Domain Connection of RAN Nodes to Multiple CN nodes ("Iu-flex", TS 23.236 [10]) features are implemented in the MSC/VLR.

The MSC/VLR can obtain the IMEISV by either the MM Identification Procedure defined in TS 24.008 [3] or by using the Cipher Mode Control procedure defined in TS 48.008 [8].

5.2.1.2 Transfer of UESBI-Iu to RAN

Editor's note: A message flow diagram should be added here.

Because of potential UE problems with the Security procedures, the MSC/VLR shall send the UESBI-Iu information to the RNC before sending the RANAP Security Mode Command message to the RNC.

[If the UESBI-Iu transfer is supported on the A interface, then the MSC/VLR should send UESBI-Iu as soon as possible (eg to permit the BSS to modify its interpretation of the Measurement Reports sent by the UE).]

5.2.2 PS Attach without Gs

The procedure can be derived from section 5.2.3, Combined PS and CS attach with Gs, by omitting the signalling via the Gs interface and the CS domain internal signalling (steps 8a – 8h, 8i and 11).

5.2.3 Combined PS and CS attach with Gs

The Combined GPRS / IMSI Attach procedure is illustrated in Figure 5.2.3-1 (copied from 3GPP TS 23.060).

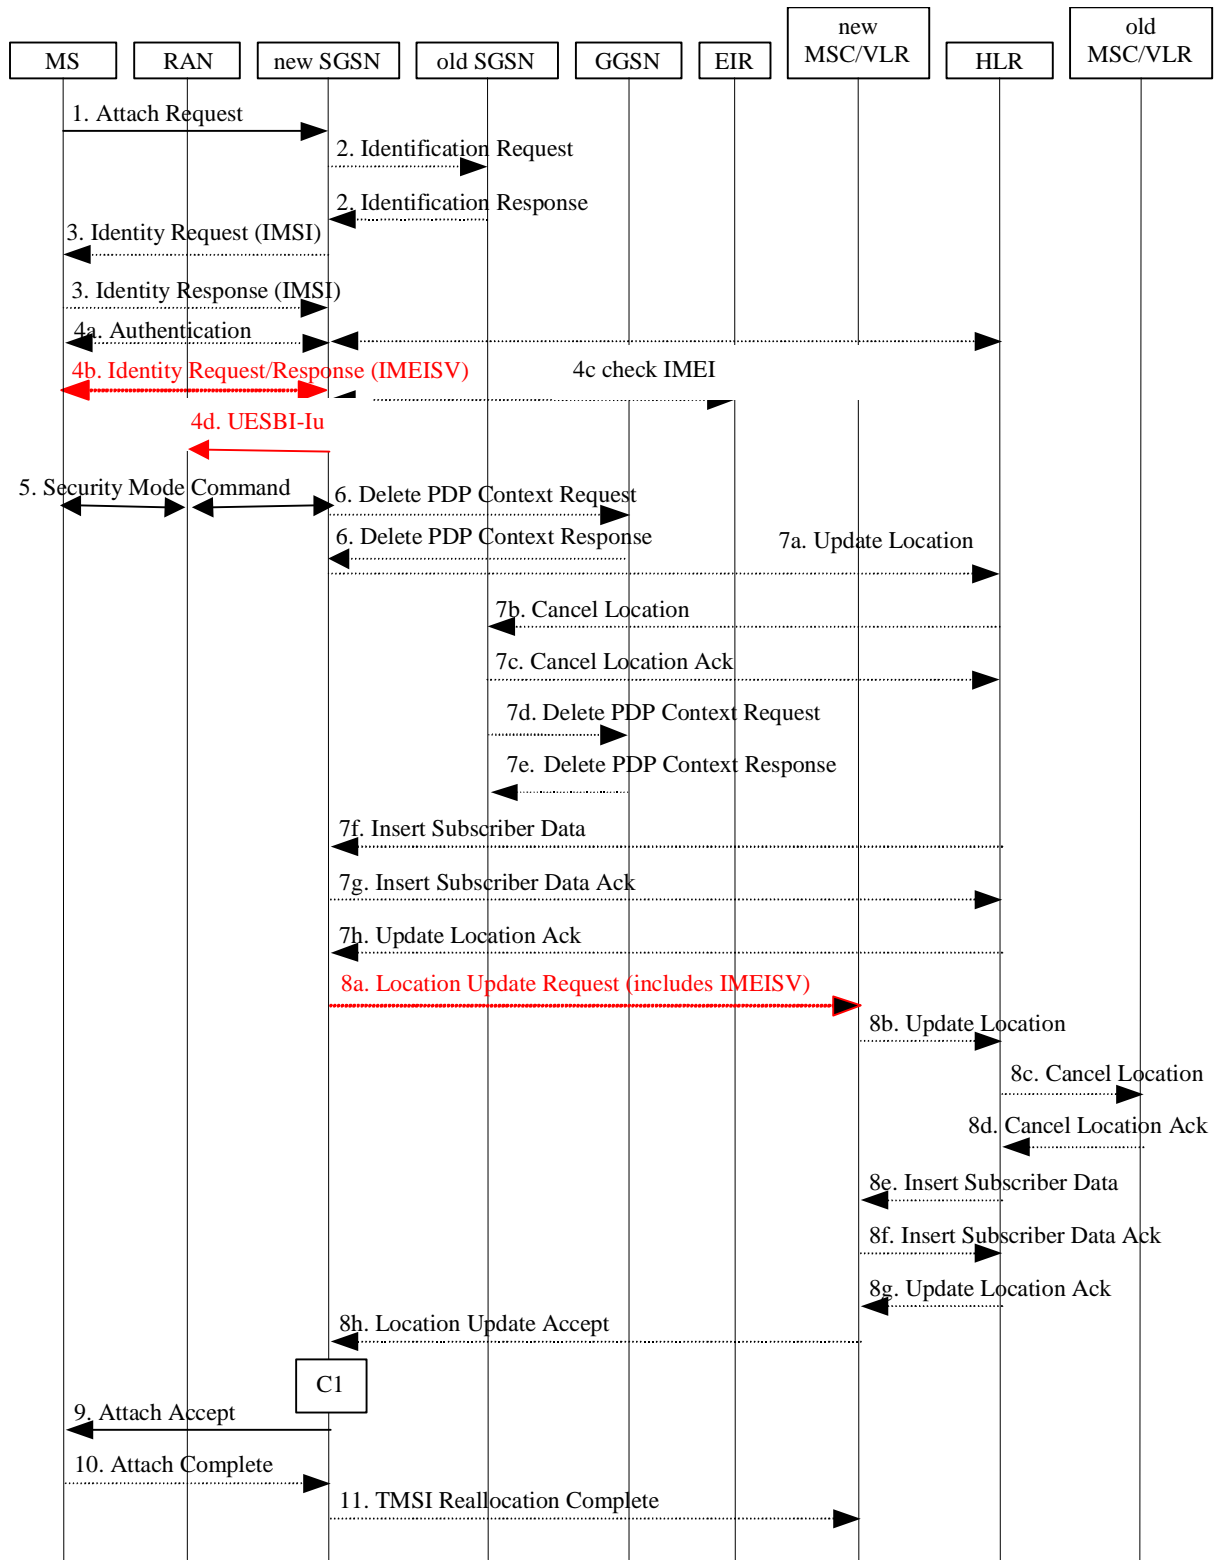

Figure 5.2.3-1: Combined GPRS / IMSI Attach Procedure

1-4) Steps 1-3 are as described in TS 23.060.

4a,b,c) The equipment checking functions are defined in the clause "Identity Check Procedures" in 23.060. The SGSN shall obtain and store the IMEISV. Equipment checking with the EIR is optional.

The SGSN can use either the GMM Identification procedure or the GMM Authentication and Ciphering procedure to obtain the IMEISV (see TS 24.008 [3]).

If the GMM Identification procedure is used to obtain the IMEISV (and the GMM Identification Request is sent before the GMM Authentication and Ciphering Request message), then it depends upon the SGSN implementation as to whether the UESBI-Iu information is sent to the RNC before or after the GMM Authentication and Ciphering Request message.

4d, 5) The SGSN shall send the UESBI-Iu information to the RNC before sending the RANAP Security Mode Command message to the RNC.

If the RNC does not receive the UESBI-Iu information before the RANAP Security Mode Command, then the RNC should assume that no UESBI-Iu information is available for this UE (for example, because the SGSN does not support the PUESBINE Feature).

6-7) Steps 6 and 7 are as described in TS 23.060.

8a) The SGSN shall send the IMEISV to the MSC in the Gs interface Location Update Request message.

If the MSC does not receive the IMEISV in Gs interface Location Update Request message (eg because the SGSN does not support the PUESBINE Feature) then the MSC shall obtain the IMEISV from the UE at the next Iu-cs or A interface connection establishment.

8) Steps 8b to 8h are as described in TS 23.060.

9-11) Steps 9 to 11 are as described in TS 23.060.

5.2.4 PS inter-SGSN Routeing Area Update without Gs

The IMEISV shall be transferred from the old SGSN to the new SGSN at inter-SGSN Routeing Area Update in the SGSN Context Response message (see TS 29.060 [11]). GTPv1 is assumed to be available in both SGSNs. The new SGSN shall transfer the UESBI-Iu to the RNC over the Iu-ps interface.

In the case of inter-SGSN RA Update from an SGSN not supporting the PUESBINE Feature to an SGSN that does support the PUESBINE Feature, then, the new SGSN shall obtain the IMEISV from the mobile using signalling specified in TS 24.008 [3] and then send the UESBI-Iu to the RNC.

5.2.5 Inter-SGSN Routing Area Update with Gs

The Combined RA / LA Update (inter-SGSN) procedure is illustrated in Figure 5.2.5-1 (copied from 3GPP TS 23.060).

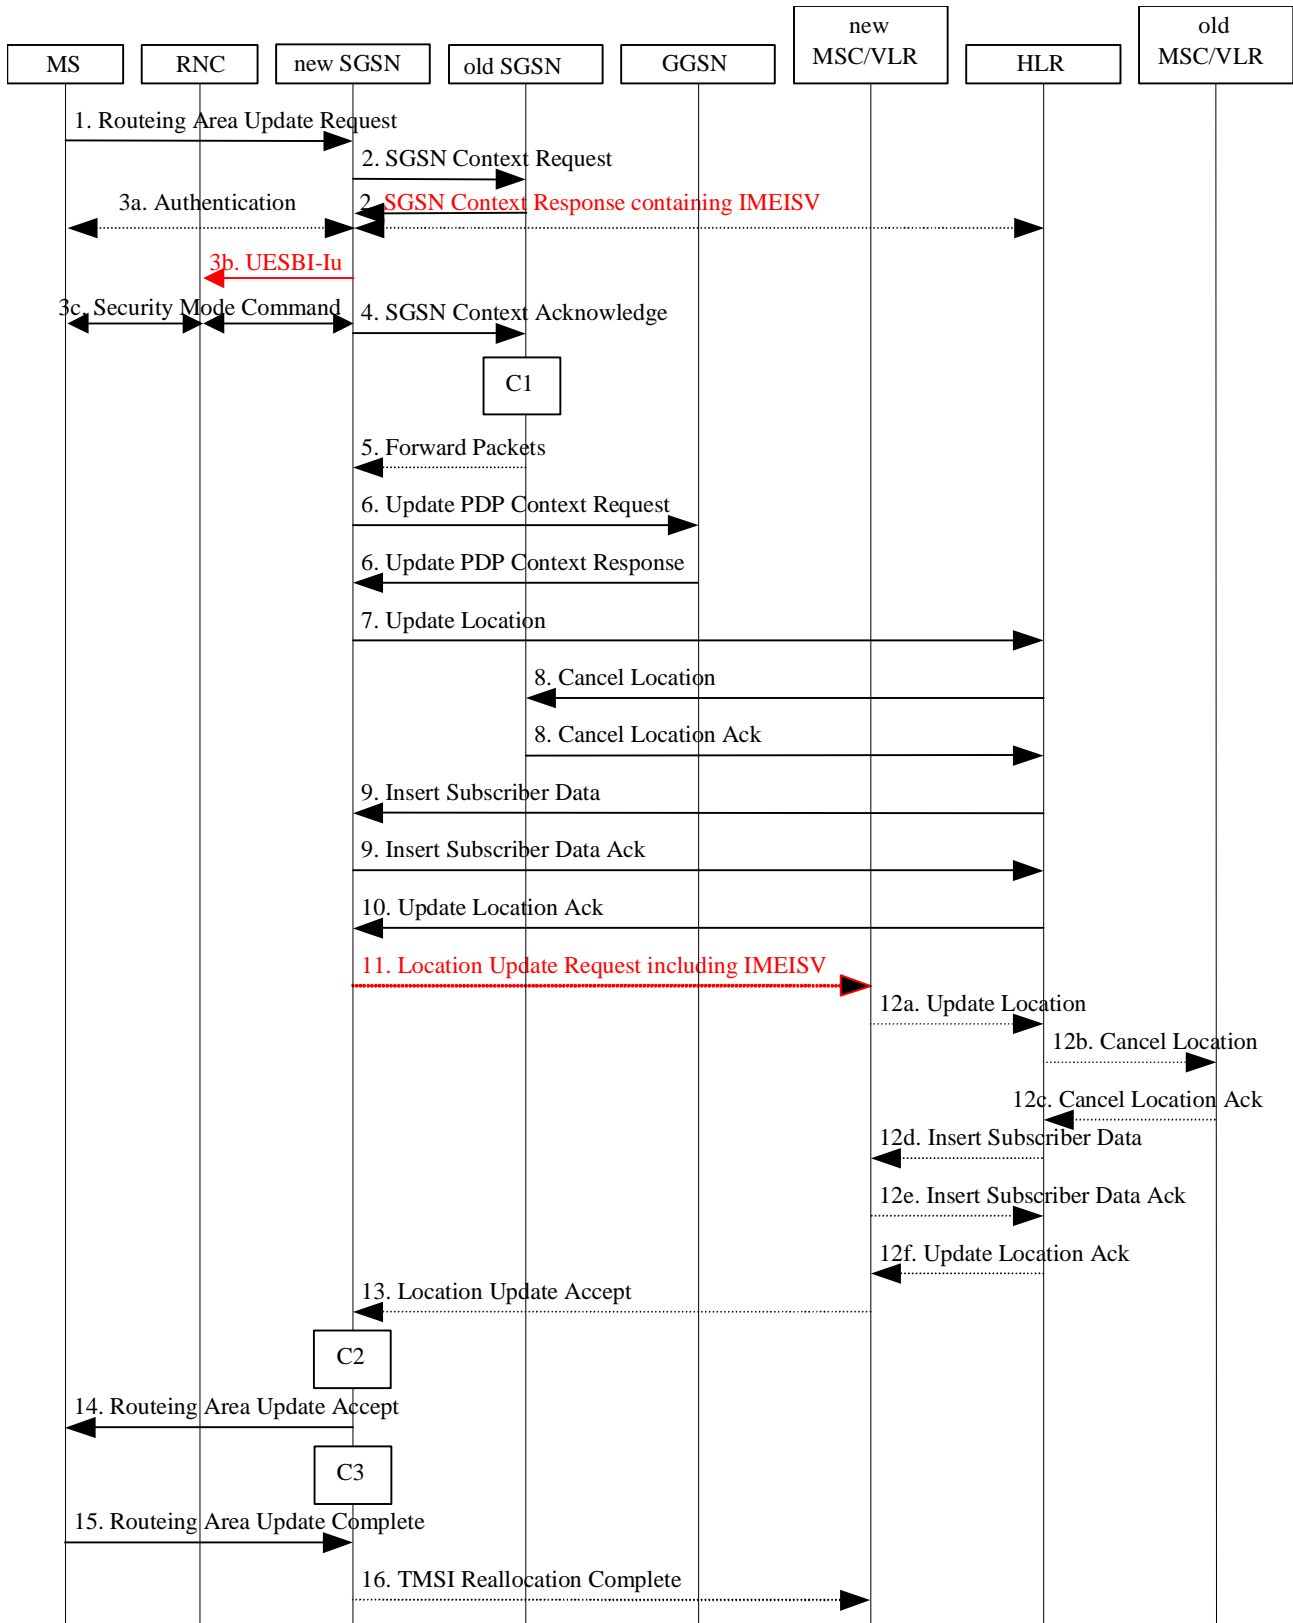

Figure 5.2.5-1: Combined RA / LA Update in the Case of Inter SGSN RA Update Procedure

- 1) The MS sends a Routing Area Update Request to the new SGSN (see TS 23.060).

- 2) The new SGSN sends SGSN Context Request to the old SGSN and the old SGSN returns the SGSN Context Response message (see TS 23.060).

The IMEISV shall be sent by the old SGSN to the new SGSN at inter-SGSN Routing Area Update in the SGSN Context Response message (see TS 29.060 [11]). GTPv1 is assumed to be available in both SGSNs.

[The new SGSN derives the UESBI-Iu from the IMEISV.]

If the new SGSN does not receive the IMEISV from the old SGSN (eg because the old SGSN does not support the PUESBINE Feature) then the new SGSN shall use GMM signalling to obtain the IMEISV from the UE.

- 3a, b, c) The new SGSN shall transfer the UESBI-Iu to the RNC over the Iu interface, and, perform authentication. The order of 3a and 3b is dependent upon the implementation of the SGSN.

The SGSN shall send the UESBI-Iu information to the RNC before sending the RANAP Security Mode Command message to the RNC.

If the RNC does not receive the UESBI-Iu information before the RANAP Security Mode Command, then the RNC should assume that no UESBI-Iu information is available for this UE (for example, because the SGSN does not support the PUESBINE Feature) (unless, in the case of non-combined RA update, the RNC has already received UESBI-Iu from the Iu-cs interface).

4 -10) Steps 4 to 10 are as described in TS 23.060.

- 11) The SGSN shall send the IMEISV to the MSC in the Gs interface Location Update Request message.

If the MSC does not receive the IMEISV in Gs interface Location Update Request message (eg because the SGSN does not support the PUESBINE Feature) then the MSC shall obtain the IMEISV from the UE at the next Iu-cs or A interface connection establishment.

12-16) Steps 12 to 16 are as described in TS 23.060.

5.2.6 CS attach when already PS attached and Gs present

The procedure described in 5.2.5 is applicable (in most cases without the SGSN change). Whether the MSC changes or not, the SGSN shall send the IMEISV to the MSC in the Gs interface Location Update Request message.

5.2.7 CS domain, transfer of UESBI-Iu to RAN

5.2.7.1 MS Initiated Iu-cs [and A Interface] Connection Establishment Procedure

[This section describes how this functionality can be made to operate on both the Iu-cs and A interfaces.]

[Note: it is an implementation choice as to whether or not to transfer UESBI-Iu across the A interface.]

[

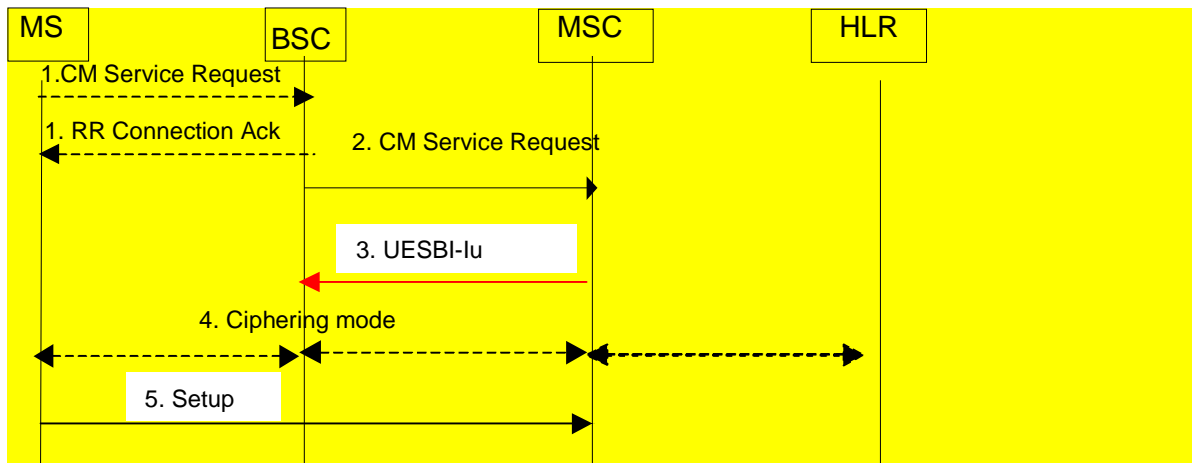

Figure 5.2.7.1-1: MS Initiated Call in GSM

]

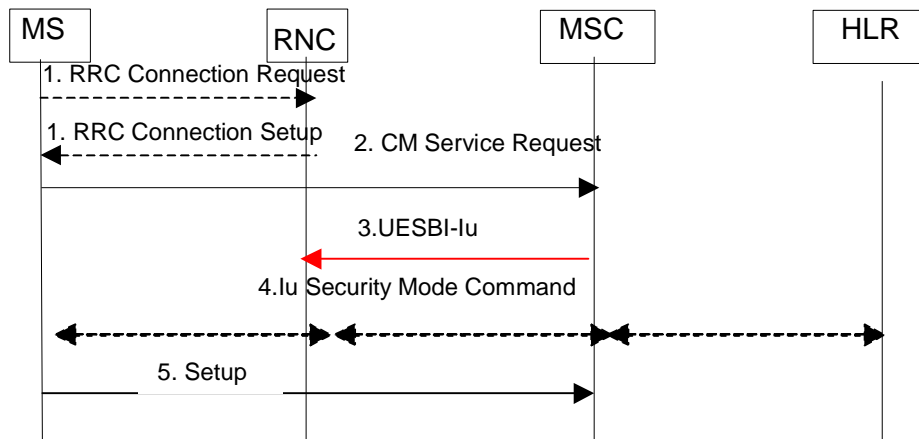

Figure 5.2.7.1-2: MS Initiated Call in UMTS

1) [In GSM, the UE establishes an RR connection by sending the first MM message (eg CM Service Request) to the BSS.]

[In UMTS, the UE establishes an RRC connection (assuming that one does not already exist for PS services).

2) [In GSM the BSS sends the first MM message to the MSC.]

[In UMTS, the UE sends the first MM message (eg CM Service Request) to the MSC.

3) [In UMTS, the MSC shall send the UESBI-Iu to the RNC.

[In GSM, if the MSC supports the transmission of the UESBI-Iu on the A interface, then the UESBI-Iu is sent to the BSS.]

The authentication procedure (if it is to be performed) can be done before or after sending the UESBI-Iu to the [BSS/]RNC.

4) [In UMTS, the Iu Security Mode command is performed.

[In GSM, either the cipherring mode command is performed or a CM Service Accept message is sent to the mobile.]

If the RNC/[BSS] does not receive the UESBI-Iu information before the RANAP Security Mode Command/[BSSMAP Cipher Mode Command], then the RNC/[BSS] should assume that no UESBI-Iu information is available for this UE (for example, because the MSC does not support the PUESBINE Feature) (and unless the RNC has already received UESBI-Iu on an existing PS domain Iu connection).

5) The first CM layer message (eg Setup or Register) is sent by the UE to the MSC.

5.2.7.2 Network Initiated Iu-cs [and A interface] Connection Establishment

[This section describes how this functionality can be made to operate on both the Iu-cs and A interfaces.]

[

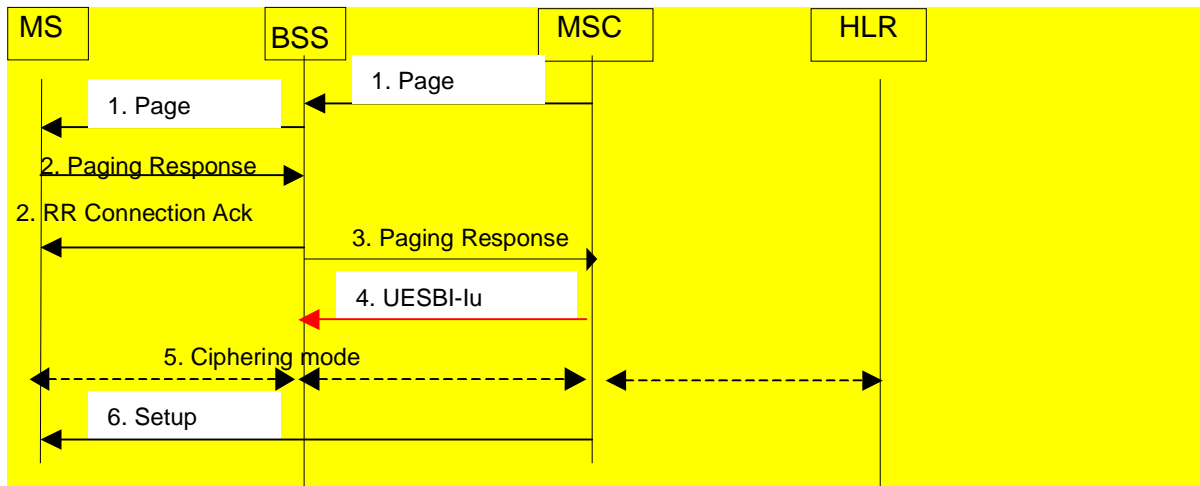

Figure 5.2.7.2-1: Network Initiated A Interface Connection Establishment (GSM)

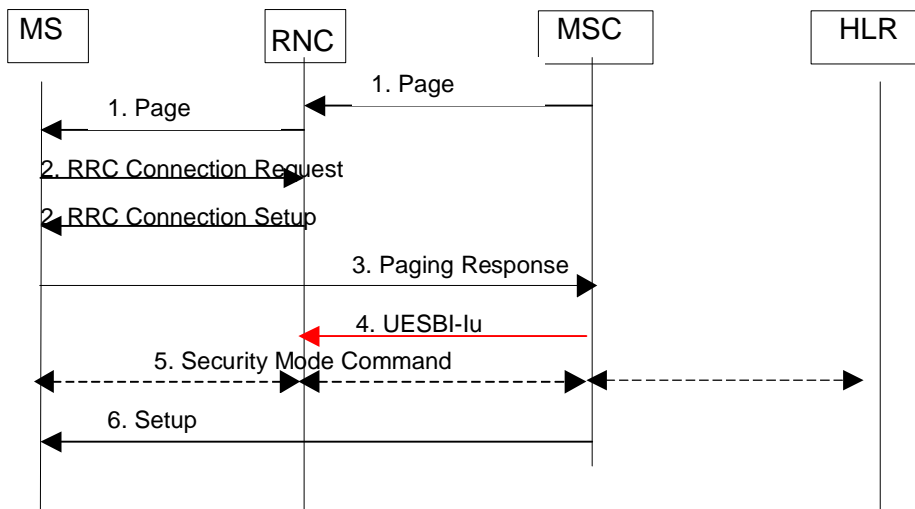

Figure 5.2.7.2-2: Network Initiated Iu-cs Interface Connection Establishment

- 1) The MSC receives some stimulus that causes it to page the [BSS]/RNC. The [BSS]/RNC then pages the mobile.
- 2) [In GSM, the UE sends the Paging Response to the BSS and the RR connection is established.]
[In UMTS, the UE establishes the RRC Connection (assuming that one does not already exist for PS services)]
- 3) [In GSM, the BSS sends the Paging Response message to the MSC.]
[In UMTS, the UE sends the Paging Response message to the MSC.]
- 4) [In UMTS, the MSC shall send the UESBI-Iu to the RNC.]
[In GSM, if the MSC supports the PUESBINE Feature on the A interface, then the UESBI-Iu is sent to the BSS.]

The authentication procedure (if it is to be performed) can be done before or after sending the UESBI-Iu information to the [BSS]/RNC.

- 5) The Iu Security mode [or A interface Ciphering Mode] command is performed.

If the RNC/[BSS] does not receive the UESBI-Iu information before the RANAP Security Mode Command/[BSSMAP Cipher Mode Command], then the RNC/[BSS] should assume that no UESBI-Iu information is available for this UE (for example, because the MSC does not support the PUESBINE Feature) (and unless the RNC has already received UESBI-Iu on an existing PS domain Iu connection).

- 6) Typically the first CM layer message (eg Setup or Register) is sent by the MSC to the UE.

5.2.8 PS domain transfer of UESBI-Iu to RNC

5.2.8.1 MS Initiated Service Request Procedure

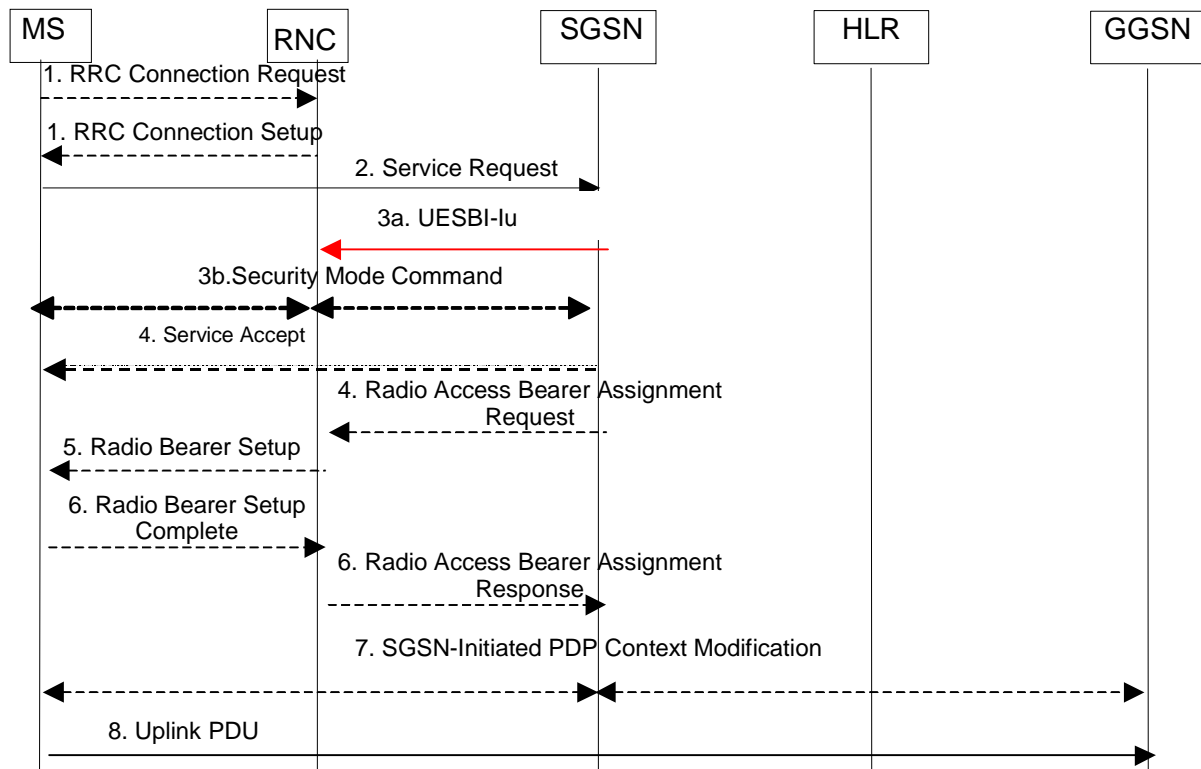

Figure 5.2.8.1-1: MS Initiated Service Request Procedure

- 1) The MS establishes an RRC connection (assuming that none exists for CS traffic).
- 2) The MS sends a Service Request (P-TMSI, RAI, CKSN, Service Type) message to the SGSN. Service Type specifies the requested service. Service Type indicates one of the following: Data or Signalling.
- 3a, b) The SGSN shall send the UESBI-Iu to the RNC before the RANAP Security Mode Command is sent. The authentication procedure (if it is to be performed) can be done before or after sending the UESBI-Iu to the RNC.

If the RNC does not receive the UESBI-Iu information before the RANAP Security Mode Command, then the RNC should assume that no UESBI-Iu information is available for this UE (for example, because the SGSN does not support the PUESBINE Feature) (and unless the RNC has already received UESBI-Iu on an existing CS domain Iu connection).

- 4-8) Steps 4 to 8 are as described in TS 23.060.

5.2.8.2 Network Initiated Service Request Procedure

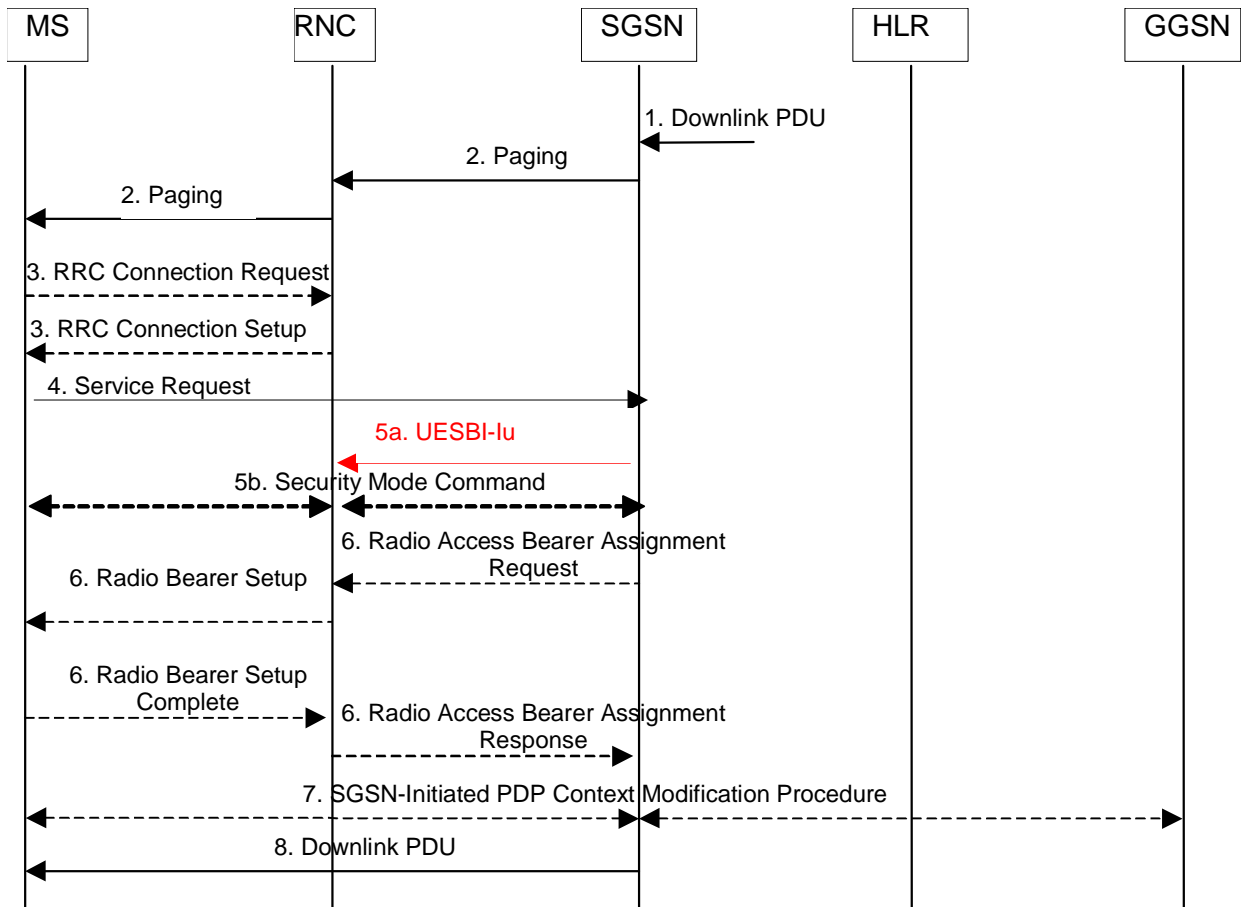

Figure 5.2.8.2-1: Network Initiated Service Request Procedure

1-4) Steps 1 to 4 are as described in TS 23.060.

The MS sends a Service Request (P-TMSI, RAI, CKSN, Service Type) message to the SGSN. Service Type specifies Paging Response.

5a, b) The SGSN shall send the UESBI-Iu to the RNC before the RANAP Security Mode Command is sent. The Authentication procedure (if it is to be performed) can be done before or after sending the UESBI-Iu to the RNC.

If the RNC does not receive the UESBI-Iu information before the RANAP Security Mode Command, then the RNC should assume that no UESBI-Iu information is available for this UE (for example, because the SGSN does not support the PUESBINE Feature) (and unless the RNC has already received UESBI-Iu on an existing CS domain Iu connection).

6-8) Steps 6 to 8 are as described in TS 23.060.

5.2.9 Intra and Inter-MSC Handover GSM to UMTS

For the intra-3G_MSC GSM to UMTS handover procedure described in 3GPP TS 23.009 [5], the UESBI-Iu shall be sent from the 3G_MSC to the target RNS in the Iu Relocation Request message.

The Basic Inter-MSC Handover GSM to UMTS is illustrated in Figure 5.2.9-1 (copied from 3GPP TS 23.009).

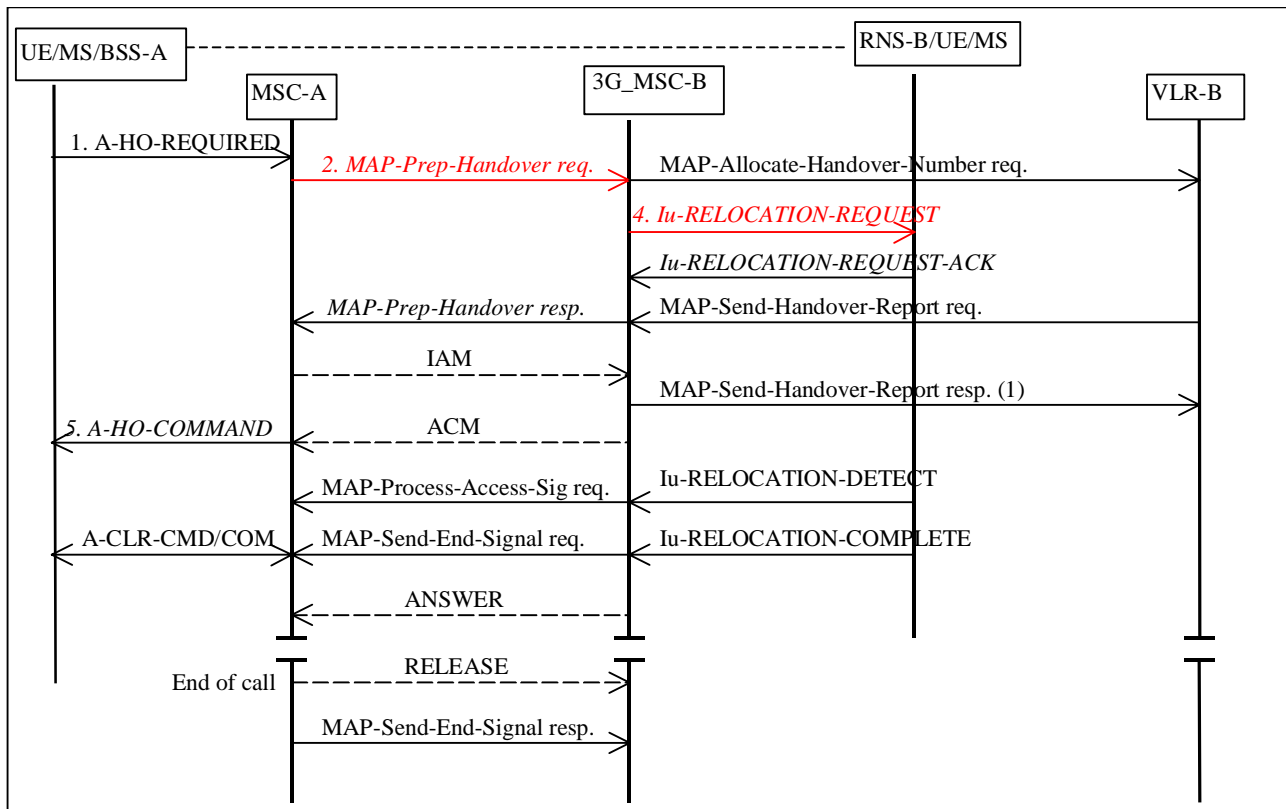

Figure 5.2.9-1 GSM to UMTS inter-MSC handover

GSM to UMTS handover is initiated as described in 3GPP TS 23.009 [5].

- 1 The UESBI-Iu is NOT sent by BSS-A to MSC-A.
- 2 **[MSC-A derives the UESBI-Iu from the IMEISV]** The UESBI-Iu shall be sent by MSC-A to 3G_MSC-B in the MAP_Prepare_Handover request message.

If 3G_MSC-B did not receive the UESBI-Iu (for example because MSC-A does not support the PUESBINE Feature) then 3G_MSC-B shall ignore this fact.

- 3 3G_MSC-B shall store the UESBI-Iu in case it is needed for a later inter RNC **[/BSS]** intra MSC-B handover .
- 4 3G_MSC-B shall include the UESBI-Iu in the Iu-RELOCATION-REQUEST message sent to the target RNC.

If the RNC does not receive the UESBI-Iu in the Iu-RELOCATION REQUEST message (eg because either MSC-A or MSC-B does not support the PUESBINE Feature) then the RNC shall not reject the Iu-RELOCATION REQUEST because the UESBI-Iu is missing.

The rest of the steps are as described in 3GPP TS 23.009 [5].

For Subsequent Inter-MSC handover, MSC-A shall transfer the UESBI-Iu to MSC-B'.

5.2.10 Inter-MSC Handover GSM to GSM

In the Basic inter-MSC handover procedure (GSM to GSM) described in 3GPP TS 23.009 [5], UESBI-Iu shall be transferred from MSC-A to MSC-B. One reason for this is because UESBI-Iu may be needed in the case that there is a later inter-system handover from GSM to UMTS under MSC-B.

The Inter-MSC Handover GSM to GSM is illustrated in Figure 5.2.10-1 (copied from 3GPP TS 23.009).

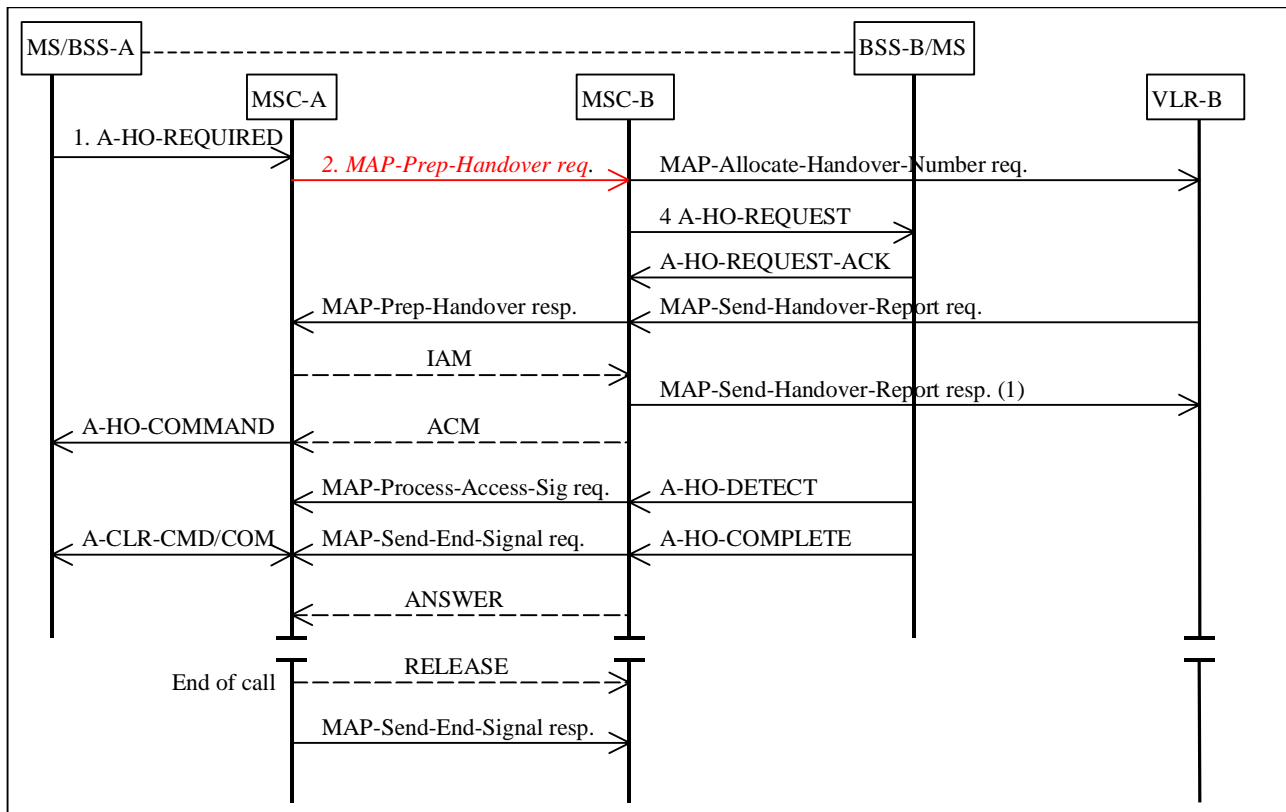

Figure 5.2.10-1. GSM to GSM inter-MSC handover

Inter-MSC GSM to GSM handover is initiated as described in 3GPP TS 23.009 [5].

- 1 The UESBI-Iu is NOT sent by BSS-A to MSC-A.
- 2 **MSC-A derives the UESBI-Iu from the IMEISV** The UESBI-Iu shall be sent by MSC-A to MSC-B in the MAP_Prepare_Handover request message.

If MSC-B did not receive the UESBI-Iu (for example because MSC-A does not support the PUESBINE Feature) then MSC-B shall ignore this fact.

- 3 MSC-B shall store the UESBI-Iu in case it is needed for a later BSS to RNC intra MSC-B handover.

[4 If MSC-A supports the transfer of UESBI-Iu on the A interface, then the UESBI-Iu shall be sent to the BSS in the Handover Request message.]

The rest of the steps are as described in 3GPP TS 23.009 [5].

For Subsequent Inter-MSC handover, MSC-A shall transfer the UESBI-Iu to MSC-B'.

5.2.11 Inter-MSC Handover UMTS to GSM

In the Basic inter-MSC handover procedure (UMTS to GSM) described in 3GPP TS 23.009 [5], UESBI-Iu shall be transferred from MSC-A to MSC-B. This is because UESBI-Iu may be needed in the case that there is a later inter-system handover from GSM to UMTS under MSC-B.

The Inter-MSC Handover UMTS to GSM is illustrated in Figure 5.2.11-1 (copied from 3GPP TS 23.009).

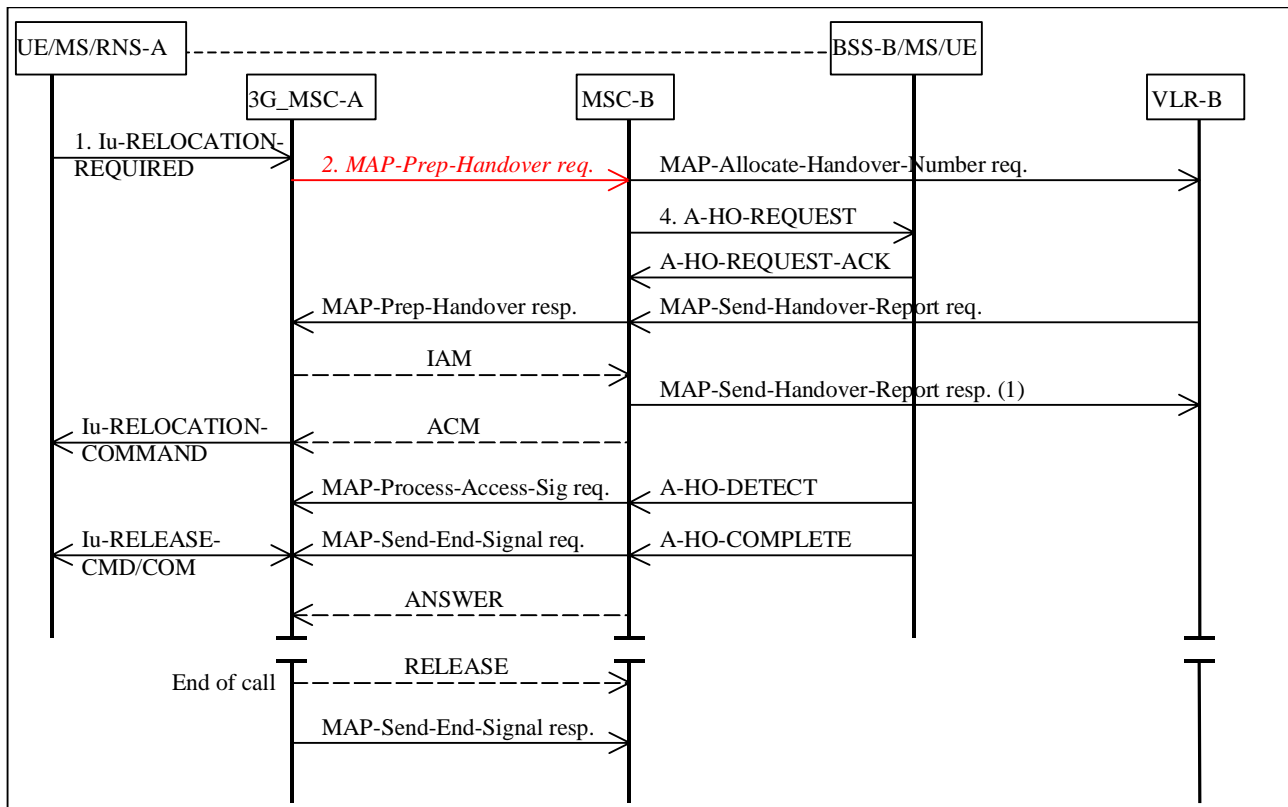

Figure 5.2.11-1 UMTS to GSM inter-MSC handover

UMTS to GSM handover is initiated as described in 3GPP TS 23.009 [5].

- 1 The UESBI-Iu is NOT sent by RNS-A to 3G_MSC-A.
- 2 **[3G_MSC-A derives the UESBI-Iu from the IMEISV]** The UESBI-Iu shall be sent by 3G_MSC-A to MSC-B in the MAP_Prepare_Handover request message.

If MSC-B did not receive the UESBI-Iu (for example because 3G_MSC-A does not support the PUESBINE Feature) then MSC-B shall ignore this fact.

- 3 MSC-B shall store the UESBI-Iu in case it is needed for a later BSS to RNC intra MSC-B handover.

- 4 **[If 3G_MSC-A supports the transfer of UESBI-Iu on the A interface, then the UESBI-Iu shall be sent to the BSS in the Handover Request message.]**

The rest of the steps are as described in 3GPP TS 23.009 [5].

For Subsequent Inter-MSC handover, MSC-A shall transfer the UESBI-Iu to MSC-B'.

5.2.12 Intra and Inter-MSC SRNS Relocation UMTS to UMTS

For the intra-3G_MSC SRNS relocation procedure described in 3GPP TS 23.009 [5], the 3G_MSC-B shall send the UESBI-Iu to the target RNS in the Iu Relocation Request message.

The Inter-MSC SRNS relocation procedure is illustrated in Figure **5.2.12-1** (copied from 3GPP TS 23.009).

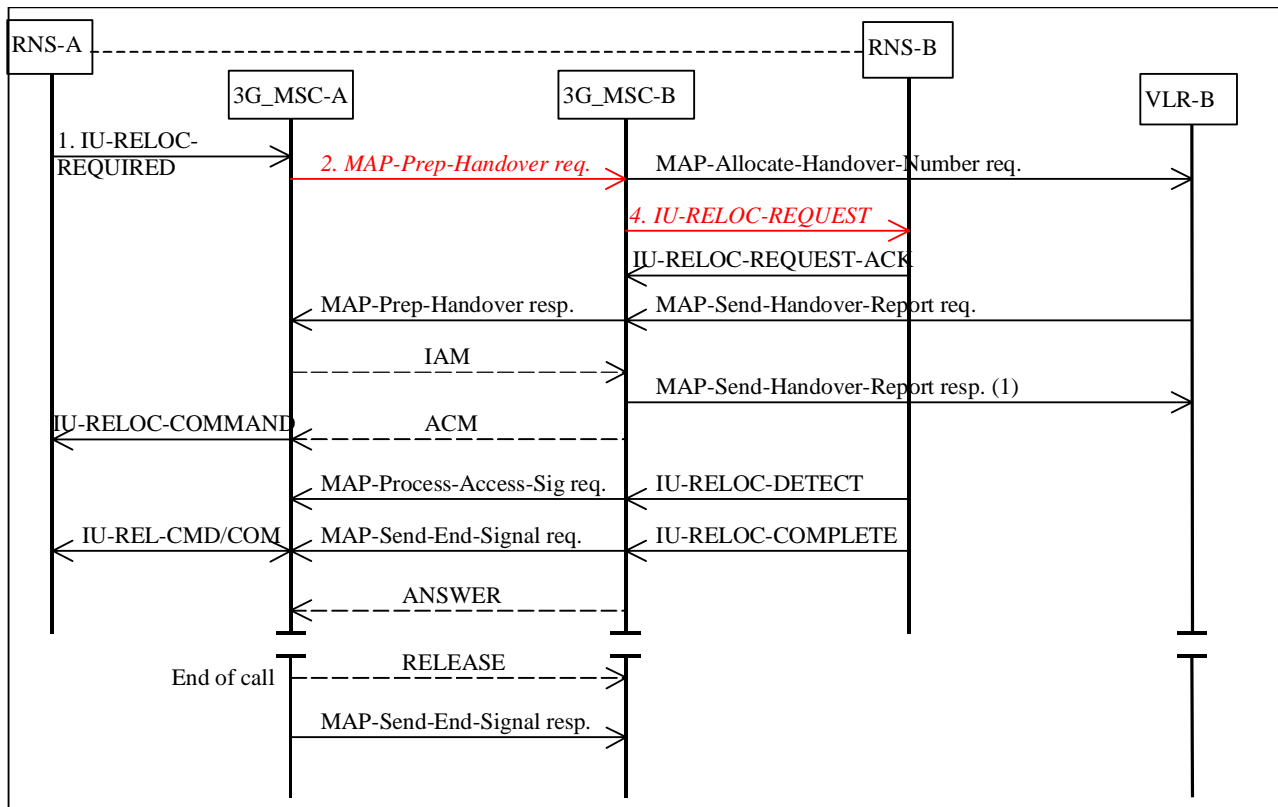

Figure 5.2.12-1. Inter-MSC SRNS relocation

Inter-MSC SRNS relocation is initiated as described in 3GPP TS 23.009 [5].

- 1 The UESBI-Iu is NOT sent by RNS-A to 3G_MSC-A.
- 2 **3G_MSC-A derives the UESBI-Iu from the IMEISV** The UESBI-Iu shall be sent by 3G_MSC-A to 3G_MSC-B in the MAP_Prepare_Handover request message.

If 3G_MSC-B did not receive the UESBI-Iu (for example because 3G_MSC-A does not support the PUESBINE Feature) then the 3G_MSC-B shall ignore this fact.

- 3 3G_MSC-B shall store the UESBI-Iu in case it is needed for a later inter RNC **[/BSS]** intra MSC-B handover.
- 4 3G_MSC-B shall send the UESBI-Iu to the target RNC in the Iu-RELOCATION-REQUEST message.

If the RNC does not receive the UESBI-Iu in the Iu-RELOCATION REQUEST message (eg because either 3G_MSC-A or 3G_MSC-B does not support the PUESBINE Feature) then the RNC shall not reject the Iu-RELOCATION REQUEST because the UESBI-Iu is missing.

The rest of the steps are as described in 3GPP TS 23.009 [5].

For Subsequent Inter-MSC handover, MSC-A shall transfer the UESBI-Iu to MSC-B'.

5.2.13 Intra and Inter SGSN SRNS Relocation (UMTS to UMTS)

For the intra SGSN SRNS relocation procedure, the SGSN shall send the UESBI-Iu to the target RNS in the Iu Relocation Request message. The Inter-SGSN SRNS relocation is illustrated in Figure 5.2.13-1 (copied from 3GPP TS 23.060).

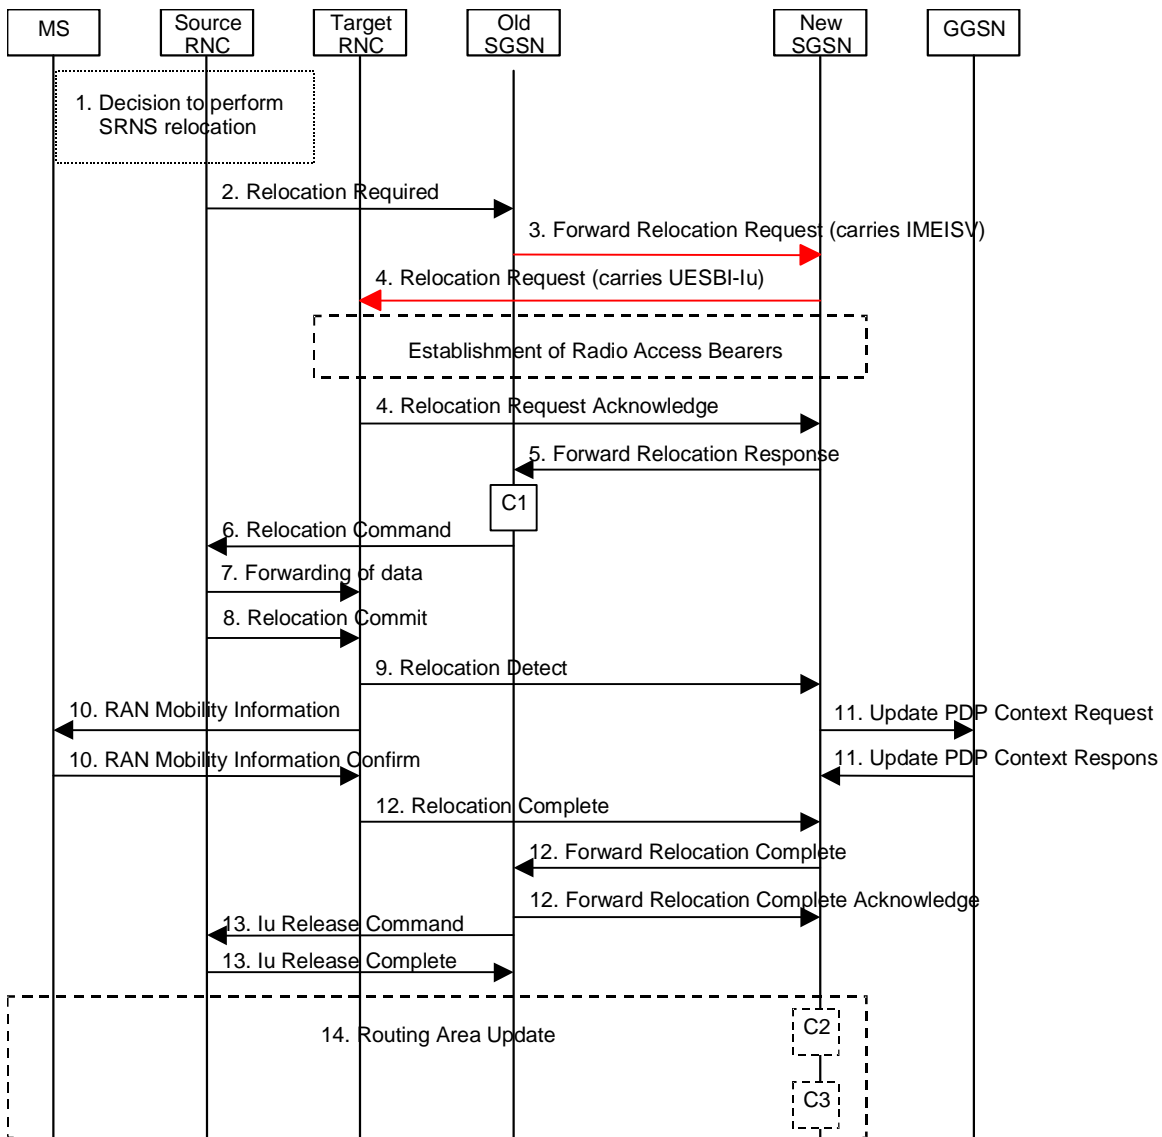

Figure 5.2.13-1. Inter-SGSN SRNS relocation

Inter-SGSN SRNS relocation is initiated as described in 3GPP TS 23.060 [4].

- 2 The UESBI-Iu is NOT sent by the Source RNC to the old SGSN.
- 3 In case of inter-SGSN SRNS relocation, the old SGSN initiates the relocation resource allocation procedure by sending a Forward Relocation Request message to the new SGSN. The old SGSN shall include the IMEISV in the Forward Relocation Request message.

If the new SGSN did not receive the IMEISV in the Forward Relocation Request message (for example because the old SGSN does not support the PUESBINE Feature), then the new SGSN shall get IMEISV from the MS during the Routing Area update procedure (step14). In this case the new SGSN shall send the UESBI-Iu to the RNC during step 14.

- 4 The new SGSN shall use the IMEISV to obtain the UESBI-Iu and then the new SGSN shall send the UESBI-Iu in the Relocation Request message to the target RNC.

If the target RNC did not receive the UESBI-Iu in the Relocation Request message (for example because either the old or the new SGSN does not support the PUESBINE Feature) then the RNC shall not reject the Iu-RELOCATION REQUEST because the UESBI-Iu is missing.

At point 14, Inter-SGSN Routing Area Update is performed as described in chapter 5.2.4.

The rest of the steps are as described in 3GPP TS 23.060 [4].

5.2.14 Emergency call handling

5.2.14.1 Mobile with (U)SIM registered in MSC/VLR

This is handled as in section 5.2.7.1, above.

5.2.14.2 Mobile without (U)SIM, or, Mobile with (U)SIM that is not registered in MSC/VLR

The MSC/VLR shall request the IMEISV from the UE using the MM Identification procedure. Once the IMEISV has been obtained, the MSC/VLR shall send the UESBI-Iu to SRNC[/BSS]. On the Iu interface, the UESBI-Iu shall be sent to the SRNC before the RAB Assignment Request message is sent. [If the MSC/VLR supports the transfer of UESBI-Iu on the A interface, then the MSC/VLR should send UESBI-Iu as soon as possible (eg to permit the BSS to modify its interpretation of the Measurement Reports sent by the UE).]

5.2.15 Special cases

The UESBI-Iu is specific to the RRC connection. The RNC shall use all sources of UESBI-Iu and update it with the latest received UESBI-Iu. Common ID messages that do not contain UESBI-Iu shall not cause the RNC to change or delete any UESBI-Iu that the RNC has already received.

Note: this requirement is intended to cover situations such as (a) UESBI-Iu is only received from one CN domain, (b) the UESBI-Iu received from CS and PS domains are different, (c) etc.

If UESBI-Iu is received after, instead of before, the RANAP Security Mode Command, then the RNC should use the UESBI-Iu for its future actions.

When the UESBI-Iu is not received for a UE, then the RNC shall assume that the UE has some default capability. This default capability is RNC implementation dependent.

6 Operational Aspects of Handling Fault Information

Editor's note: text for this section will be derived from the contents of Annex B once decisions on "Bitmap vs IMEISV on Iu" and "standardised vs O+M" have been made.

Annex A (Informative): Compatibility with Network Entities Not Supporting the PUESBINE Feature

A.1 General

This annex gives information on the interworking between network entities that support the PUESBINE Feature and those that do not. Where this interworking leads to actual requirements on a network entity, then these requirements should be documented in the main body of this TS.

A.2 Inter SGSN Relocation

From an SGSN that does not support the PUESBINE Feature to an SGSN that does support the PUESBINE Feature:

The target RNC will not receive the UESBI-Iu in the Relocation Request message and adopts some generic behaviour. The later arrival of UESBI-Iu at RNC is used by the RNC for any future processing for that UE.

From an SGSN that does support the PUESBINE Feature to an SGSN that does not support the PUESBINE Feature:

The target RNC does not receive the UESBI-Iu, but, this is reasonable considering that the RNC's 'default' SGSN does not support the PUESBINE Feature. GTP error handling should ensure that reception of the IMEISV is ignored by an SGSN that does not support the PUESBINE Feature.

A.3 Inter SGSN Routing Area Update

From an SGSN that does not support the PUESBINE Feature to an SGSN that does support the PUESBINE Feature:

If an SGSN that supports the PUESBINE Feature does not receive the IMEISV from the old SGSN, then the new SGSN shall get the IMEISV from the MS.

From an SGSN that does support the PUESBINE Feature to an SGSN that does not support the PUESBINE Feature:

GTP error handling should ensure that reception of the IMEISV is ignored by an SGSN that does not support the PUESBINE Feature.

A.4 Iu interface issues

If UESBI-Iu is not received for a UE, then the RNC assumes that the UE has some default capability. This default capability is RNC implementation dependent.

The RNC can assume that a CN that supports the PUESBINE Feature will deliver the UESBI-Iu before the RANAP Security Mode command.

RANAP error handling should ensure that reception of the UESBI-Iu is ignored by an RNC that does not support the PUESBINE Feature.

A.5 Gs issues

If the MSC does not receive the IMEISV in the Gs interface Location Update Request message, then the MSC obtains the IMEISV from the UE at the next Iu-cs/A interface connection establishment.

Gs interface error handling should ensure that reception of the IMEISV in the Gs interface Location Update Request message is ignored by an MSC that does not support the PUESBINE Feature.

A.6 inter MSC issues.

If the anchor MSC does not pass the UESBI-Iu information to the relay MSC, then the target RNC **[BSS]** does not receive the UESBI-Iu information. This is handled as an "Iu interface issue" (see section A.4).

MAP error handling should ensure that reception of the UESBI-Iu is ignored by a relay MSC that does not support the PUESBINE Feature.

A.7 RNC - BSS issues

If the RNC sends the new Relocation Request Reject cause value then the MSC needs to be able to map this into an appropriate A interface cause value.

Does the RANAP error handling and/or 29.010 provide a default mapping?

Editor's note: check the CN 4 status of this?

A interface error handling procedures should ensure that reception of the new Cause value is treated in a backwards compatible manner by a BSS that does not support the PUESBINE Feature.

A.8 A interface issues

With regard to the new Handover Reject Cause value, see section A.7.

With regard to using the 'old BSS to new BSS information' IE to transfer the "don't handover to UMTS flag" between BSSs, then existing A interface error handling procedures should ensure that this flag is ignored by a BSS that does not support the PUESBINE Feature.

[If a BSS supports the PUESBINE Feature and the UESBI-Iu is not received for, then the BSS assumes that the UE has some default capability. This default capability is BSS implementation dependent.]

[If UESBI-Iu is sent across the A interface, then existing A interface error handling procedures should ensure that the UESBI-Iu is ignored by a BSS that does not support the PUESBINE Feature.]

Annex B (informative): Operational Aspects of Handling Fault Information

If the "bitmap vs IMEISV on Iu" decision is made in favour of the "bitmap on Iu" then ONE of either section B.1.1 or B.1.2 shall be chosen. If the decision is in favour of "IMEISV on Iu" then one of B.2.1 or B.2.2 shall be accepted. Then the text needs to be modified to stage 2 parlance and moved to section 6.

B.1 If UESBI-Iu is BMUEF

B.1.1 UESBI-Iu mapping from IMEISV in SGSN and MSC using standardised signalling

The SGSN and MSC derive the UESBI-Iu by mapping from the IMEISV's TAC+SVN. Locally cached databases in the SGSN and MSC provide the mapping information. A central database (ie the Faulty IMEISV to BMUEF register) should be used to provide the mapping information to the local databases. The central database is interrogated by a local database when a not yet known TAC+SVN is to be mapped by the local database. The local database stores the mapping information received from the central database.

The local databases should periodically interrogate the central database to update the mapping information. The period is configuration specific. Each signalling message between MSC/SGSN and central database retrieves the BMUEF for just one TAC+SVN.

No functionality is expected on the FIB to MSC/SGSN interface for the FIB to "push" updated BMUEF to the MSC/SGSNs. Instead, it shall be possible to trigger the MSC/SGSN to update the locally cached mapping.

Signalling between the MSC/SGSN and central database (ie the Faulty IMEISV to BMUEF register) shall be based on MAP. The FIB may be implemented in an EIR, but it shall be possible to implement the FIB register on a standalone node (ie it shall be possible for an operator to deploy the FIB without having to deploy an EIR). The FIB function is expected to process many fewer messages than an EIR, and, might have lesser availability requirements than an EIR.

B.1.2 UESBI-Iu mapping from IMEISV in SGSN and MSC via O+M

Distributed conversion databases in SGSNs and MSCs can be updated using O&M functionality in the network. Existing O+M procedures can be utilized, so there is no need for further standardisation.

The O+M functionality shall give the operator full control over setting/not setting any of the bits/parameters within the BMUEF for each TAC+SVN. This is necessary because the RNC(s) may be supplied by different vendors to the CN entities.

Additional O+M care is needed to ensure that the BMUEF at MSC and SGSN are synchronised (eg when SGSN and MSC are supplied by different vendors).

B.2 If UESBI-Iu is IMEISV

B.2.1 Handling of fault information (When UESBI-Iu is the IMEISV) via O+M

Databases in RNCs can be updated using O&M functionality in the network. Existing O+M procedures can be utilized, so there is no need for further standardisation. As probably not every detected UE fault is relevant to every RNC, every new identified fault will not necessarily require changes in the RNC or O+M system.

To avoid adapting RNC modules each time a new TAC+SVN requires the same corrective measure that is already implemented, a mapping of TAC+SVN to UE behaviour may be beneficial in the RNC.

Additional O+M care is needed to ensure that the fault information at RNCs from multiple vendors are synchronised (if the fault needs fixing in both types of RNC).

B.2.2 Handling of fault information (When UESBI-Iu is the IMEISV) via standardised interface

A centralized function performs the TAC+SVN to Bitmap conversion and the RNC performs the Bitmap to fault conversion (centralized database). In order to support multi vendor RANs, a standardised interface is required to interrogate the centralised function.

To avoid adapting RNC modules each time a new TAC+SVN requires the same corrective measure that is already implemented, a mapping of TAC+SVN to UE behaviour is needed in the RNC.

Title: LS on Stage 3 work for Early UE handling
Release: Release 5 or earlier

Source: SA WG2
To: CN WG1, CN WG4, RAN WG3, GERAN WG2
Cc: RAN WG2

Contact Person:

Name: Ravi Kuchibhotla, Motorola
E-mail Address: Ravi.Kuchibhotla@motorola.com

Attachments: S2-031951 (3GPP TS 23.195 v 1.2.0)

SA WG2 has now completed almost all of the work it has been tasked with on the early UE feature. The architecture principles have been agreed in SA2 and captured in the attached version of the TS 23.195 v1.2.0. As stated in the earlier LS on this topic, the previous version of the TS had already captured all of the basic principles and hence there are few differences with the current version of the TS. The final version of the specification that will be provided to the SA plenary for approval and placement under change control is going through email approval on the SA2 reflector, the week of May 19-23, 2003. Only minor editorial changes are expected during this process.

SA2 has also agreed on a more formal name for the feature - PUESBINE - Provisioning of UE Specific Behaviour Information to Network Entities.

SA WG2 hopes that Stage 3 work has already been started based on the earlier version of TS 23.195 that has been made available. SA WG2 would continue to appreciate feedback in cases where the concepts are unsatisfactory or if particular aspects are missing from the specification.

Actions

To CN WG1, CN WG4, RAN WG3, GERAN WG2

ACTION: SA WG2 requests the above groups to continue their Stage 3 work on the PUESBINE feature based on the attached Stage 2 specification.

To RAN WG2

ACTION: None

Date of Next TSG SA WG2 Meetings

TSG SA WG2 Meeting #33	7 th – 11 th July 2003	France
TSG SA WG2 Meeting #34	18 th – 22 nd August, 2003	Brussels, Belgium
