

To: 3GPP TSG RAN WG1
Title: Typical Radio Parameter Sets Version 1.3
Source: GSMA ISG
Document for: Information

Summary

“Typical radio parameter sets” was revised in the ad hoc of ISG to correct errors and to fix TBD parameters. The attached document is the latest version (version 1.3) of “Typical radio parameter sets”, which was approved in ISG, to be submitted to the appropriate 3GPP TSGs and WGs. The major changes from the version 1.2 to version 1.3 are summarised in the appendix “Overview of Typical Radio Interface Parameter Sets version 1.3”.

Please note that the version 1.3 is now stable except for a following editorial error. There is no plan to revise the document in ISG except for corrections of editorial errors and serious technical errors.

An editorial error

In the following section, DCCH bit rate of 1.7kbps should be applied as the section title says. However, the subsections in these sections show DCCH bit rate of 3.4 kbps. These subsections should be corrected to show 1.7 kbps DCCH.

- 5.4.1.10 Conversational/Speech/UL 5.15 DL5.15 /CS RAB + UL1.7 DL1.7kbps SRB for DCCH
- 5.4.1.11 Conversational/Speech/UL 4.75 DL4.75 /CS RAB + UL1.7 DL1.7kbps SRB for DCCH

Typical Radio Interface Parameter Sets

Version 1.3

1. Scope

This document describes the typical parameter sets for layer 1 and 2 configurations preferred by operators to ensure interoperability. It has to be noted that these sets of prioritised parameters are not imposing constraints in the standard, nor removing the flexibility which has been included in the standard as a requirement from the operators, nor will the document define specific essential services for roaming in IMT-2000(UTRA FDD) networks. Moreover, the identification of typical parameter sets does not prevent operators to exploit full flexibility in their networks by the use of parameter settings which are not mentioned in this document. It is expected that the prioritised parameter sets identified in this document will be reflected in the test specifications for UTRA FDD mobile handsets, forming the first class testing cases.

3. Abbreviations

AM	Acknowledgement mode
BCCH	Broadcast Control Channel
CBS	Cell Broadcast Service
CC	Convolutional coding
CCCH	Common Control Channel
CCTrCH	Coded Composite Transport Channel
CS	Circuit switching
DCCH	Dedicated Control Channel
DL	Downlink
DPCH	Dedicated Physical Channel
DT	Direct transfer
DTCH	Dedicated Traffic Channel
FTM	File tunnelling mode
NAS	Non-access stratum
PRACH	Physical Random Access Channel
PS	Packet switching
RAB	Radio Access Bearer
RB	Radio Bearer
SCCPCH	Secondary Common Control Physical Channel
SMS	Short Message Service
SRB	Signalling RB
SSD	Source statistics descriptor
TC	Turbo coding
TM	Transparent mode
UL	Uplink
UM	Unacknowledgement mode

4. QoS Architecture and RAB attributes

From a user point-of-view services are considered end-to-end, this means from a Terminal Equipment (TE) to another TE. An End-to-End Service may have a certain Quality of Service (QoS) which is provided for the user through the different networks. In UMTS, it is the UMTS Bearer Service that provides the requested QoS through the use of different QoS classes as defined in TS 23.107 [3].

The UMTS Bearer Service consists of two parts, the Radio Access Bearer Service, RAB, and the Core Network Bearer Service. The Radio Access Bearer Service is realised by a Radio Bearer Service and an Iu-Bearer Service. The relationship between the services is illustrated in figure 1.

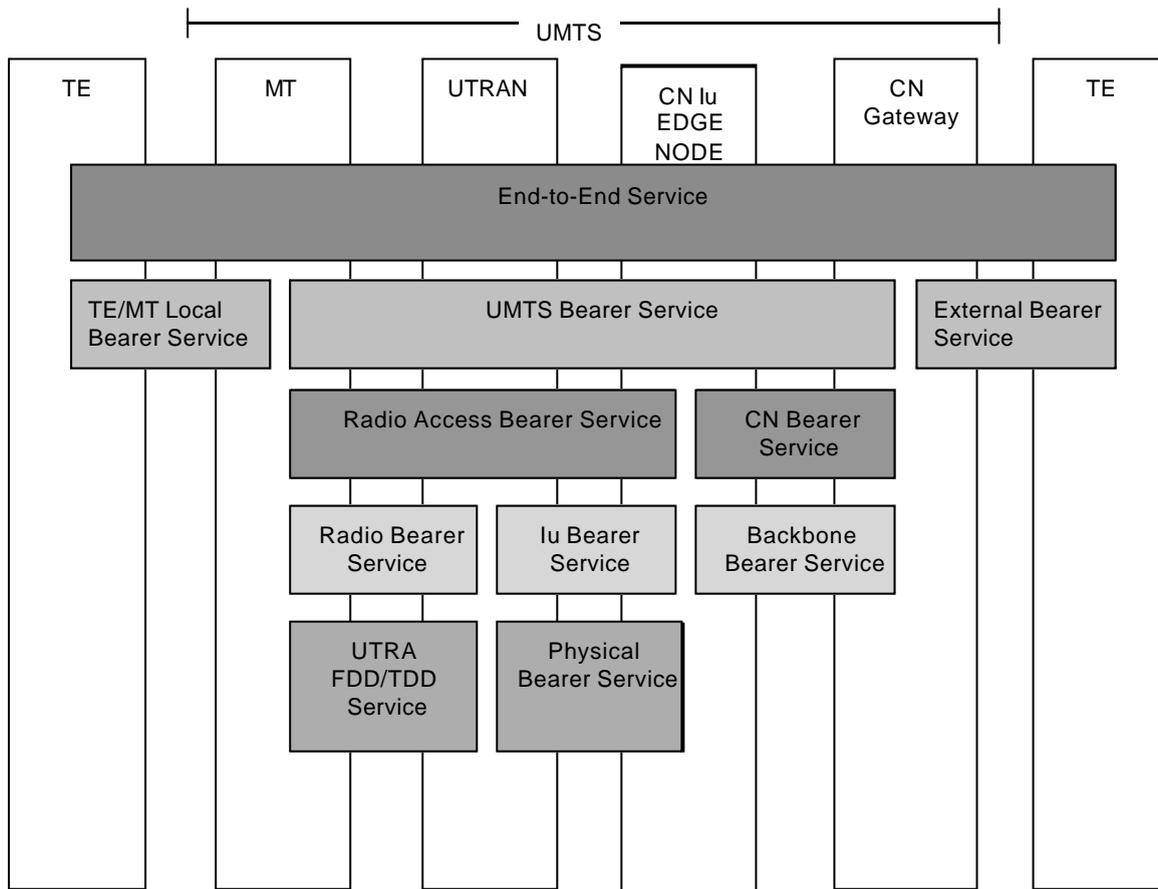

Figure 1: UMTS QoS Architecture

The Radio Access Bearer Service is characterised by a number of attributes such as Traffic class, Maximum bit rate, Guaranteed bit rate, SDU error ratio, Residual BER, Transfer Delay etc [3]. As a first approach the four following attributes have been considered to come up with the parameter settings in section 5.4:

- Traffic class
- SSD
- Maximum bit rate
- Residual BER

The Traffic classes are explained in table 1. The Maximum bit rate has been considered at RLC layer and Physical Layer for the acknowledged and unacknowledged modes respectively. The Residual BER is understood as BER at RLC layer and Transport BLER for the acknowledged and unacknowledged modes respectively.

Table 1: Traffic classes

Traffic class	Conversational class conversational RT	Streaming class streaming RT	Interactive class Interactive best effort	Background Background best effort
Fundamental characteristics	- Preserve time relation (variation) between information entities of the stream Conversational pattern (stringent and low delay)	- Preserve time relation (variation) between information entities of the stream (i.e. some but constant delay)	Request response pattern Preserve payload content	Destination is not expecting the data within a certain time Preserve payload content
Example of the application	- speech, video, ...	- facsimile (NT) - streaming audio and video	- Web browsing	- background download of emails

5. RAB and signalling RB

5.1. RABs and signalling RBs

In the following sections, the typical parameter sets are presented for reference RABs, signalling RBs and important combinations of them. The data rate given for each RAB is the maximum data rate that can be supported by that RAB. NOTE: The granularity for each RAB needs to be clarified.

Table 2: Prioritised RABs.

#	Traffic class ^[3]	SSD ^[3]	Max. rate, kbps	CS/PS
1	Conversational	Speech	UL:12.2 DL:12.2	CS

8	DL:24 (alt. 6.4)	PCCH	SCCPCH

5.2. Combinations of RABs and Signalling RBs

In this document, physical channel parameters for following combinations of RABs and signalling RBs on a CCTrCH are described.

Note: It is understood that for speech service the AMR mode may be operated asymmetrically for the uplink and downlink.

Combinations on DPCH

- 1) Stand-alone UL:1.7 DL:1.7 kbps SRBs for DCCH

5.3. Example of linkage between RABs and services

RABs, which are included in this document, can provide the services as shown in Table 1. Furthermore, the required BER for each RAB, which is assumed in this document, is shown in Table 4.

Table 4: Example of linkage between RABs and services

RAB				Residual BER ^[3]	Services
Traffic class ^[3]	SSD ^[3]	Max. rate, kbps	CS/PS		
Conversational	Speech	UL:4.75-12.2 DL:4.75-12.2	CS	5×10^{-4} , 1×10^{-3} , 5×10^{-3}	AMR speech
Conversational	Unknown	UL:64 DL:64	CS	1×10^{-4} or 1×10^{-6}	UDI 1B, 64k 3G-324M ^[4]
Conversational	Unknown	UL:32 DL:32	CS	1×10^{-4} or 1×10^{-6}	32k 3G-324M ^[4]
Conversational	Unknown	UL:28.8 DL:28.8	CS	1×10^{-3}	Transparent modem
Streaming	Unknown	UL:14.4 DL:14.4	CS	1×10^{-3}	FAX ^[6]
Streaming	Unknown	UL:28.8 DL:28.8	CS	1×10^{-3}	FAX ^[6]
Streaming	Unknown	UL:57.6 DL:57.6	CS	1×10^{-3}	PIAFS 32 kbps Modem ^[6] , FTM ^[5] , PIAFS 64 kbps
Streaming	Unknown	UL:64-128 or DL:64-384	CS or PS	1×10^{-3} or 1×10^{-4}	Streaming video, uni-directional
Interactive or Background	N/A	UL:32-384 DL:8-2048	PS	1×10^{-3} or 1×10^{-4}	Packet

Note: SMS can be provided via the signalling RB (DCCH) on DPCH or SCCPCH.

Note: CBS can be provided via the signalling RB (CTCH) on SCCPCH

Note: UDI *n*B can be provided via *n* RABs of conversational 64 kbps.

	Max number of DPDCH data bits/radio frame	600 (alt. 1200)
	Puncturing Limit	1

<Appendix>

Overview of Typical Radio Interface Parameter Sets version 1.3

This appendix describes major changes from the Typical radio interface parameter sets version 1.2 to version 1.3 as following.

1. Stand-alone UL:3.4 DL:3.4 kbps SRBs for DCCH

Numbers of pilot bits of the slot format was changed from 8 bits to 4 bits to use shorter (1 slot) adjustment delay of feedback command for closed loop mode Tx diversity in as a big cell as possible.

2. Cprrections of TFs for AMR RAB subflow #2 and #3

In the version 1.2, AMR RAB subflow #2 and #3 have three TFs. These are error since AMR RAB subflow #2 and #3 have two TFs. These errors were corrected in the version 1.3.

3. Note *1 under the transport channel parameter tables for AMR

Note *1 under the transport channel parameter tables for AMR were changed to explain TFC detection scheme for AMR clearly.

4. CRC parity bits attachment for 0 TrBlk in UL

In the version 1.2, CRC attachment for 0 TrBlk size is applied to both UL and DL for conversational speech RAB for better outer-loop TPC performance. On the other hand, there is a concern on overhead caused by CRC OK/NG transmission during DTX on Iub if this function is applied to UL. Considering this concern, CRC attachment for 0 TrBlk size was changed to optional in the version 1.3.

5. Clarification of TFCS

A new section for TFCS was added in all RAB/SRB combinations of the version 1.3 to clarify TFCS size and TFCS. This new section was described under section "Transport channel parameters" which was also added in the version 1.3.

6. SF for PDSCH in section 5.4.2.4.2

SF for PDSCH was corrected to 8 in section 5.4.2.4.2.

7. Rate mattching attributes

Ranges of RM attributes for all RAB/SRB combinations were clarified according to simulation results. There is no TBD in the version 1.3.

8. Addition of 10 ms TTI alternative for I/B UL 384 kbps PS RAB

According to comments from 3GPP TSG RAN WG2, 10ms TTI was revived as an alternative for Interactive or Background UL 384 kbps PS RAB.

9. Addition of a new MAC header size for UM DCCH on SCCPCH

In the version 1.2, there was a mistake to revise that this addition was done in PRACH. In the version 1.3, this addition was applied to SCCPCH correctly, and the mistake in PRACH was corrected in the version 1.3.
