Title: LS to SMG, TSG-SA on ARIB Requirements

Document for: Information

A drafting subgroup of TSG-S1 identified a number of possible differences between ARIB and SMG service requirements for UMTS R99. In particular it noted the following differences; 384 kbps for circuit switched; requirement for wideband speech; possible approach to fax standardisation; need for paging service. Due to the preliminary nature of this study the possibility of other differences remains.

ARIB will study the 22.00 series in greater detail and proposes to produce appropriate amendments to the 22.00 series within the context of 3GPP in order to harmonise essential service requirements for R99.
