Topic: Lawful Intercept support on the Mc interface

It is a legal requirement that circuit switched bearer be subject to intercept based upon targeted subscription identifiers. As such, the MGW has been identified as a point of CS bearer intercept as controlled by the MSC server. Therefore, an intercept trigger should be included on the Mc interface (using H.248 for example). S3 LI solicits your support is developing such as standard intercept control message to invoke intercept in the MGW. We are interested in helping define such a message. Please provide comment.

Best regards,

S3 LI
