Topic: Lawful Intercept support on the Mc interface

It is a legal requirement that circuit switched bearer be subject to intercept based upon targeted subscription identifiers. As such, the MGW has been identified as a point of CS bearer intercept as controlled by the MSC server. S3 LI solicits your support in developing such as standard intercept control message to invoke intercept in the MGW. S3 LI plans to include detailed definitions of the interception portions of this interface by 3rd quarter 2001. Please provide comment.

Best regards,

Bernie McKibben
