TSG-SA WG 2 meeting #23 Sophia Antipolis, 18-22/2/02

TSG S2-020912 rev of S2-020863

Title: LS on Stage 2 for use of USIMs and ISIMs for IMS

To: CN1, SA 3, T3

CC: SA 1, CN 4

Source: SA 2

**Contact Person:** Name: Chris Pudney

E-mail: Chris.pudney@vf.vodafone.co.uk

**Attachments**: S2-020862; S2-020695

SA 2 thanks SA 1 for the LS in S1-020577 (=S2-020695) on 'Access to IMS Services using 3GPP release 99 and release 4 UICCs'.

In response to this LS, SA 2 have updated the stage 2 description in 23.228. Please see the attached CR in S2-020862.

For R'99 and R'4 USIMs, this CR proposes that the Private User Identity and Home Network Domain Name are derived from the IMSI. This did not cause much discussion. However, with regard to the Public User Identity, there was quite a long discussion as to whether this should be derived from the MSISDN and/or the IMEI, or whether it could be left "empty", or, whether to use the IMSI again. The eventual consensus within SA 2 was to also derive the Public User Identity from the IMSI.

In order to limit options, and hence to reduce the amount of testing needed for current and future mobiles, the CR indicates that R'5 IMS aware UICCs should have an ISIM application.

## **Actions**

## To CN 1 (or possibly CN 4):

To draft the necessary stage 3 CRs. eg in 23.003, to specify the rules for deriving these identities from the IMSI.

## To SA 3

To advise other 3 GPP committees if they see any security difficulties with this approach.

## To T3

To use the stage 2 CR to guide your stage 3 work.

## 1. Overall Description:

SA1 would like to inform SA3, T3 and CN1 of a requirement to allow access to IMS services using 3GPP release 99 and release 4 UICCs.

SA1 believe that the principle of backward compatibility of SIMs is well established, as in the cases of GSM phase 1 to phase 2, GSM to GPRS and GSM/GPRS to 3GPP release 99. SA1 require that the principle of backward compatibility should similarly be established for 3GPP release 99/release 4 to IMS.

SA1 understands that the public and private identities generated from USIM parameters may be sub-optimal i.e. not so readable as <a href="mailto:imm.brown@operator.net">imm.brown@operator.net</a> or that it may not be possible to have several public identities per subscription. However, it is understood that this limitation can be overcome by various means e.g. OTA provisioning.

SA1 also acknowledges that for Release 5 and later the access independence requirement is still valid so that public and private identities shall be generated optimally.

## 2. Actions:

#### To SA3 group.

Please confirm that this requirement can be fulfilled without degrading the security of the 3GPP system.

#### To T3, CN1 group.

Does this requirement have any other technical limitations?

#### 3. Date of Next SA1 Meetings:

Reason for change: # For operational, roll out and inter-operability testing reasons it is necessary to be able to operate IMS services using an unmodified R'99 USIM.

Summary of change: # With R'5 IMS capable UICCs, it is expected that 3 types of identity are stored on the ISIM, namely the Private User Identity, the Public User identity and the Home Network Domain Name.

To support the use of an unmodified R'99 USIM, the proposal is that:

- a) the Private User Identity is derived from the IMSI;
- b) the Public User Identity is derived from the IMSI (SA 2 considered deriving the Public User Identity from the MSISDN and/or IMEI however, after discussion there was an overall preference to use the IMSI); and
- c) the Home Network Domain name is derived from the leading 6 digits of the IMSI (these include the Mobile Country Code and Mobile Network Code).

The detailed encoding of these fields is a stage 3 matter. Hence this CR only describes this capability in abstract terms.

R'5 UICCs for IMS are expected to have an ISIM application in addition to the USIM application.

In order to limit options, this CR only permits two ways of implementing the UE-UICC relationship: namely an unmodified R'99/R'4 USIM and a UICC with an ISIM application.

Consequences if not approved:

# An unnecessary and large barrier will be placed in the way of introducing IMS services if R'99 USIMs cannot be used.

Clauses affected: # 2, 3.3, 4.3.3.1, 4.3.3.2 and 4.3.3.4.

# 4.3.3 Identification of users

There are various identities that may be associated with a user of IP multimedia services. This section describes these identities and their use.

## 4.3.3.1 Private user identities

Every IM CN subsystem subscriber shall have a private user identity. The private identity is assigned by the home network operator, and used, for example, for Registration, Authorisation, Administration, and Accounting purposes. This identity shall take the form of a Network Access Identifier (NAI) as defined in RFC 2486 [14]. It is possible for a representation of the IMSI to be contained within the NAI for the private identity.

- The Private User Identity is not used for routing of SIP messages.
- The Private User Identity shall be contained in all Registration requests, (including Re-registration and Deregistration requests) passed from the UE to the home network.
- An ISIM application shall securely store the Private User Identity shall be securely stored on the USIM. If the UICC does not have an ISIM application, then, the Private User Identity shall be derived from the USIM's IMSI. The rules for deriving the Private User Identity from the IMSI are specified in 3GPP TS 23.003 [24]. (International shall not be possible for the UE to modify the UICC's Private User Identity information).
- The Private User Identity is a unique global identity defined by the Home Network Operator, which may be used within the home network to uniquely identify the user from a network perspective.
- The Private User Identity shall be permanently allocated to a user (it is not a dynamic identity), and is valid for the duration of the user's subscription with the home network.
- The Private User Identity is used to identify the user's information (for example authentication information) stored within the HSS (for use for example during Registration).
- The Private User Identity may be present in charging records based on operator policies.
- The Private User Identity identifies the subscription (e.g. IM service capability) not the user.
- The Private User Identity is authenticated only during registration of the subscriber, (including re-registration and de-registration).
- The HSS and S-CSCF need to obtain and store the Private User Identity.

#### 4.3.3.2 Public user identities

Every IM CN subsystem subscriber shall have one or more public user identities [8]. The public user identity/identities are used by any user for requesting communications to other users. For example, this might be included on a business card.

- Both telecom numbering and Internet naming schemes can be used to address users depending on the Public User identities that the users have.
- The public user identity/identities shall take the form of SIP URL (as defined in RFC2543 [12] and RFC2396 [13]) or E.164 numbers.
- An ISIM application shall securely store aAt least one Public User Identity-shall be securely stored on the USIM (it shall not be possible for the UE to modify the Public User Identity), but it is not required that all additional Public User Identities be stored on the ISIM application USIM. If the UICC does not contain an ISIM application, then, the Public User Identity shall be derived from the USIM's IMSI. The rules for deriving the Public User Identity from the IMSI are specified in 3GPP TS 23.003 [24].
- It shall be possible to register globally (i.e. through one single UE request) a subscriber that has more than one public identity via a mechanism within the IP multimedia CN subsystem (e.g. by using a Service Profile). This shall not preclude the user from registering individually some of his/her public identities if needed.
- Public User Identitys are not authenticated by the network during registration.

- Public User Identities may be used to identify the user's information within the HSS (for example during mobile terminated session set-up).

# 4.3.3.3 Routing of SIP signalling within the IP multimedia subsystem

Routing of SIP signalling within the IMS shall use SIP URLs. E.164 [2] format public user identities shall not be used for routing within the IMS, and session requests based upon E.164 format public user identities will require conversion into SIP URL format for internal IMS usage.

## 4.3.3.4 Relationship of private and public user identities

The home network operator is responsible for the assignment of the private user identifier, and public user identifiers; other identities that are not defined by the operator may also exist.

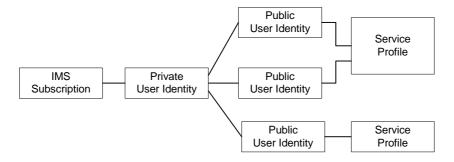

Figure 4.5: Relationship of the private user identity and public user identities

All Public user identities that are associated with the same Service Profile should have the same set of services. Public user identities that are associated with a different Service Profile could have a different set of services. Each Public user identity is only associated with a single Service Profile.

All Service Profiles that share the same Private user identity are associated to the same S-CSCF. Later releases may allow different Service Profiles that share the same Private user identity to be associated with different S-CSCFs.

An ISIM application shall securely store the home domain name of the subscriber. shall be stored securely on the USIM If the UICC does not have an ISIM application, then, the home domain name shall be derived from the Mobile Country Code and Mobile Network Code fields of the USIM's IMSI. The rules for deriving the home domain name from the IMSI are specified in 3GPP TS 23.003 [24]., (Iit shall not be possible for the UE to modify the information from which the home domain name is derived).

The storage location of the Private User Identity, Public User Identity and home domain name for a standalone SIP Client could be stored on the USIMISIM.

Editors Note: Mechanisms used to extract the Private User Identity, Public User Identity and home domain name from the USIM<u>ISIM</u> (e.g. when an external SIP TE is used) are for further study of the groups T2, T3 and SA3.

It is not a requirement for a user to be able to register on behalf of another user or for a device to be able to register on behalf of another device or for combinations of the above for the IM CN subsystem for this release.

Editor's Note: Public User Identity Portability issues are FFS.
