Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| RRC State Indicator | CELL_PCH     |

8.3.1.2.5 Test requirement

After step 2 the UE shall reselect to cell 2 and transmit a CELL\_UPDATE message, containing the IE "Cell update cause" set to "cell reselection".

After step 6 the UE shall transmit a CELL\_UPDATE message on the CCCH with IE "Cell update cause" set to "paging response".

8.3.1.3 Cell Update: periodical cell update in CELL\_FACH

8.3.1.3.1 Definition

8.3.1.3.2 Conformance requirement

This procedure is to update UTRAN with the current cell information, after the UE has remained in the service area in the CELL\_FACH state for a period exceeding the timer value T305.

Reference

3GPP TS 25.331 clause 8.3.1

8.3.1.3.3 Test purpose

To confirm that the UE executes a periodical cell update procedure following the expiry of timer T305.

8.3.1.3.4 Method of test

Initial Condition

System Simulator: 2 cells—Cell 1 and 2 are active.

UE: PS-DCCCH+DTCH\_FACH (state 6-11) in cell 1 as specified in clause 7.4 of TS 34.108.

Test Procedure

Table 8.3.1.3

| Parameter              | Unit         | Cell 1 |     | Cell 2 |     |
|------------------------|--------------|--------|-----|--------|-----|
|                        |              | T0     | T1  | T0     | T1  |
| UTRA—RF Channel Number |              | Ch. 1  |     | Ch. 1  |     |
| CPICH Ec               | dBm/3.84 MHz | -60    | -75 | -75    | -60 |

Table 8.3.1.3 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution.

The UE is in CELL\_FACH state. When the UE detects the expiry of timer T305 according to the settings in system information, the UE transmits a CELL\_UPDATE message to the SS on the uplink CCCH with a cause indicating periodical cell updating. SS replies with a CELL\_UPDATE\_CONFIRM message, and IE "RRC State Indicator" is set to "CELL\_FACH". SS verifies that the UE does not transmit any uplink message. SS then waits for T305 to expire again. The UE shall send another CELL\_UPDATE message to report periodic cell updating. After the SS receives this message, it transmits a CELL\_UPDATE\_CONFIRM message which includes the IEs "new C-RNTI", "new U-RNTI" to the UE on the downlink DCCH. Then the UE shall transmit an UTRAN MOBILITY INFORMATION\_CONFIRM message on the uplink DCCH to acknowledge the receipt of the new UE identities. Next, SS transmits UTRAN MOBILITY INFORMATION message, which includes IE "T305" set to "infinity", to UE. UE shall transmit UTRAN MOBILITY INFORMATION\_CONFIRM message. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.1.3, causing the UE to enter CELL\_FACH state in cell 2 and transmit a CELL\_UPDATE message on uplink CCCH with IE "Cell update cause" set to "cell reselection". Then SS shall transmit CELL\_UPDATE

CONFIRM. SS then monitors the uplink CCCH for a period up to the maximum possible value for timer T305 (720 minutes) and verifies that no CELL\_UPDATE message is received. After this, the SS transmits UTRAN MOBILITY INFORMATION message, which includes IE "T305" set to '5', to UE. UE shall transmit UTRAN MOBILITY INFORMATION CONFIRM message. SS configures its downlink transmission power settings according to columns "T0" in table 8.3.1.3, causing the UE to enter CELL\_FACH state in cell 1 and transmit a CELL\_UPDATE message on uplink CCCH with IE "Cell update cause" set to "cell reselection". Then SS shall transmit CELL\_UPDATE CONFIRM. UE shall resume periodic cell updating procedure and transmit CELL\_UPDATE message after T305 (5 minutes) expires.

#### Expected sequence

| Step | Direction |    | Message                            | Comment                                                                                                      |
|------|-----------|----|------------------------------------|--------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                    |                                                                                                              |
| 1    |           |    |                                    | The UE is in the CELL_FACH state. SS waits until T305 has expired.                                           |
| 2    | →         |    | CELL_UPDATE                        | IE "Cell update cause" shall be set to "periodical cell updating"                                            |
| 3    | ←         |    | CELL_UPDATE CONFIRM                | No RNTI identities are given. No information on PRACH and S-CCPCH are provided.                              |
| 4    |           |    |                                    | SS verifies that no uplink message is received from UE. SS waits for another period to allow T305 to expire. |
| 5    | →         |    | CELL_UPDATE                        | Set to "periodical cell update" in IE "Cell update cause" upon the expiry of timer T305.                     |

### Specific Message Contents

#### CELL UPDATE (Step 2 and 5)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC-Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'periodical cell updating' |

#### CELL UPDATE (Step 11 and 17)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                                                                                               |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|
| U-RNTI              |                                                                                                                            |
| -SRNC-Identity      | Check to see if set to '0000-0000-0001'                                                                                    |
| →S-RNTI             | Check to see if set to same bit string as in IE "S-RNTI" in IE "U-RNTI" of the CELL UPDATE CONFIRM message sent in step 6. |
| Cell Update Cause   | Check to see if set to "cell reselection"                                                                                  |

**CELL UPDATE CONFIRM (Step 3, 12, 18 and 20)**

Use the same message sub-type found in Annex A.

**CELL UPDATE CONFIRM (Step 6)**

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark                                                         |
|---------------------|----------------------------------------------------------------------|
| New U-RNTI          | Set to '0000 0000 0001'                                              |
| - SRNC Identity     | Set to an arbitrary string different from '0000 0000 0000 0000 0001' |
| - S-RNTI            |                                                                      |

**CELL UPDATE (Step 19)**

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                                                                                               |
|---------------------|----------------------------------------------------------------------------------------------------------------------------|
| U-RNTI              | Check to see if set to '0000 0000 0001'                                                                                    |
| - SRNC Identity     | Check to see if set to same bit string as in IE "S-RNTI" in IE "U-RNTI" of the CELL UPDATE CONFIRM message sent in step 6. |
| - S-RNTI            | Check to see if set to 'periodical cell updating'                                                                          |
| Cell Update Cause   |                                                                                                                            |

**UTRAN MOBILITY INFORMATION (Step 8)**

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element                       | Value/remark |
|-------------------------------------------|--------------|
| New U-RNTI                                | Not Present  |
| New C-RNTI                                | Not Present  |
| UE Timers and constants in connected mode |              |
| -- T305                                   | infinity     |

**UTRAN MOBILITY INFORMATION (Step 14)**

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element                       | Value/remark |
|-------------------------------------------|--------------|
| New U-RNTI                                | Not Present  |
| New C-RNTI                                | Not Present  |
| UE Timers and constants in connected mode |              |
| -- T305                                   | 5            |

**8.3.1.3.5 Test requirement**

After step 1 the UE shall detect the expiry of timer T305 and then transmits a CELL UPDATE message setting value "periodical cell update" into IE "Cell update cause".

After step 3 the UE shall not send any uplink message as a response to CELL UPDATE CONFIRM message sent in step 3.

After step 4 the UE shall send a CELL UPDATE message, specifying the cell updating cause to be "periodical cell update".

After step 6 the UE shall transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.

After step 8, the UE shall transmit a UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH using AM RLC.

After step 10, the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "cell reselection" on the uplink CCCH.

Between step 12 and 14, the UE shall not transmit any CELL UPDATE message.

After step 14, the UE shall transmit a UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH using AM RLC.

After step 16, the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "cell reselection" on the uplink CCCH.

After step 18, the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "periodical cell update" on the uplink CCCH.

8.3.1.4 Cell Update: periodical cell update in CELL\_PCH

8.3.1.4.1 Definition

8.3.1.4.2 Conformance requirement

This procedure is to update UTRAN with the information of the current cell when the UE detects that it is still in the service area, while residing in the CELL\_PCH state, after the expiry of timer T305.

Reference

3GPP TS 25.331 clause 8.3.1

8.3.1.4.3 Test purpose

To confirm that the UE, in CELL\_PCH state, executes a cell update procedure after the expiry of timer T305.

8.3.1.4.4 Method of test

Initial Condition

System Simulator: 2 cells—Cell 1 and 2 are active.

UE: CELL\_PCH (state 6-12) in cell 1 as specified in clause 7.4 of TS 34.108.

Test Procedure

Table 8.3.1.4

| Parameter              | Unit         | Cell 1 |     | Cell 2 |     |
|------------------------|--------------|--------|-----|--------|-----|
|                        |              | T0     | T1  | T0     | T1  |
| UTRA—RF Channel Number |              | Ch. 1  |     | Ch. 1  |     |
| CPICH-Ec               | dBm/3.84 MHz | -60    | -75 | -75    | -60 |

Table 8.3.1.4 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution.

The UE starts from CELL\_PCH state. When the UE detects the expiry of periodic cell updating timer T305 according to the system information, the UE moves to CELL\_FACH state. It shall transmit a CELL\_UPDATE message on the uplink CCCH and set the value "periodical cell update" into IE "Cell update cause". SS answers with a CELL\_UPDATE CONFIRM message. SS transmits UTRAN MOBILITY INFORMATION message, which includes IE "T305" set to "infinity", to UE. UE shall transmit UTRAN MOBILITY INFORMATION CONFIRM message. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.1.4, causing the UE to enter CELL\_FACH state in cell 2 and transmit a CELL\_UPDATE message on uplink CCCH with IE "Cell update cause" set to "cell reselection". Then SS shall transmit CELL\_UPDATE CONFIRM with IE "RRC state indicator" set to "CELL\_PCH". Then UE shall enter CELL\_PCH state. SS then monitors the uplink CCCH for a period up to the maximum possible value for timer T305 (720 minutes) and verifies that no CELL\_UPDATE message is received. SS then configures its downlink transmission power settings according to columns "T0" in table 8.3.1.4, causing the UE to enter CELL\_FACH state in cell 1 and transmit a CELL\_UPDATE message on uplink CCCH with IE "Cell update cause" set to "cell reselection". Then SS shall transmit CELL\_UPDATE CONFIRM. Next, SS transmits UTRAN MOBILITY INFORMATION message, which includes IE "T305" set to "5", to UE. UE shall transmit UTRAN MOBILITY INFORMATION CONFIRM message. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.1.4, causing the UE to enter CELL\_FACH state in cell 2 and transmit a CELL\_UPDATE message on uplink CCCH with IE "Cell update cause" set to "cell reselection". Then SS shall transmit CELL\_UPDATE CONFIRM with IE "RRC state indicator" set to "CELL\_PCH". Then UE shall enter CELL\_PCH state. After T305 expires, UE shall transmit CELL\_UPDATE message with IE "cell update cause" set to "periodical cell update". SS shall transmit CELL\_UPDATE CONFIRM message to end the procedure.

#### Expected sequence

| Step | Direction |    | Message                            | Comment                                                                                                                                                                                                                        |

### Specific Message Contents

#### CELL UPDATE (Step 2 and 19)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'periodical cell updating' |

#### CELL UPDATE (Step 7, 11 and 16)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to "cell reselection"         |

#### CELL UPDATE CONFIRM (Step 3, 12 and 20)

Use the same message sub-type found in Annex A.

**CELL UPDATE CONFIRM (Step 8 and 17)**

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| RRC-state indicator | CELL_PCH     |

**UTRAN MOBILITY INFORMATION (Step 4 and 13)**

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element                       | Value/remark                                   |
|-------------------------------------------|------------------------------------------------|
| New-U-RNTI                                | Not Present                                    |
| New-C-RNTI                                | Not Present                                    |
| UE-Timers and constants in connected mode |                                                |
| -T305                                     | Set to 'infinity' in step 4 and '5' in step 13 |

**8.3.1.4.5 Test requirement**

After step 1 the UE shall detect the expiry of timer T305, it shall then move to CELL\_FACH state and transmits a CELL UPDATE message with the IE "Cell update cause" set to "periodical cell update".

After step 4, the UE shall transmit a UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH using AM-RLC.

After step 6, the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "cell reselection" on the uplink CCCH.

After step 8 and before step 10, the UE shall not transmit any CELL UPDATE messages.

After step 10, the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "cell reselection" on the uplink CCCH.

After step 13, the UE shall transmit a UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH using AM-RLC.

After step 15, the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "cell reselection" on the uplink CCCH.

After step 18 the UE shall transmit a CELL UPDATE message stating the cell update cause to be periodic updating.

**8.3.1.5 Cell Update: UL data transmission in URA\_PCH****8.3.1.5.1 Definition****8.3.1.5.2 Conformance requirement**

This procedure is to update UTRAN with the current cell information if the UE wants to transmit uplink data while in URA\_PCH state.

**Reference**

3GPP TS 25.331 clause 8.3.1

**8.3.1.5.3 Test purpose**

To confirm that the UE executes a cell update procedure when the UE transmits uplink data if the UE is in URA\_PCH state.

#### 8.3.1.5.4 Method of test

##### Initial Condition

System Simulator: 1cell

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.

##### Test Procedure

SS sends a MEASUREMENT CONTROL message to trigger UE to measure the CPICH RSCP in a intra frequency measurement and to report periodically by the MEASUREMENT REPORT message using UM RLC. UE shall send MEASUREMENT REPORT message to SS using UM RLC on DCCH. SS then transmit a RADIO BEARER RELEASE message with IE "RRC State Indicator" is set to "URA\_PCH". The UE shall reply with RADIO BEARER RELEASE COMPLETE message and move to URA\_PCH state. UE shall detect that the periodical timer for measurement reporting has elapsed and attempt to transmit a MEASUREMENT REPORT message. The UE then moves to CELL\_FACH state and transmits a CELL UPDATE message to the SS on the uplink CCCH, with the IE "Cell update-cause" set to value "uplink data transmission". After receiving such a message, SS transmits CELL UPDATE CONFIRM message. The UE shall stay in CELL\_FACH state and transmit MEASUREMENT REPORT message using UM RLC on DCCH.

##### Expected sequence

**CELL UPDATE (Step 6)**

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| – SRNC Identity     | Check to see if set to '0000-0000-0001'           |
| – S-RNTI            | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'uplink data transmission' |

**CELL UPDATE CONFIRM (Step 7)**

Use the same message sub-type found in Annex A.

**MEASUREMENT REPORT (Step 3 and 8)**

Only the message type IE in this message will be checked.

**RADIO BEARER RELEASE COMPLETE (Step 5)**

Only the message type IE in this message will be checked.

**8.3.1.5.5 ————— Test requirement**

After step 2, UE shall transmit a MEASUREMENT REPORT message to SS using UM RLC on DCCH when 64 seconds has elapsed since the acknowledgement of MEASUREMENT CONTROL message.

After step 4, UE shall transmit a RADIO BEARER RELEASE COMPLETE message and move to URA\_PCH state.

After step 5, the UE shall move to CELL\_FACH state to initiate a cell update procedure and transmits a CELL UPDATE message which is set to "uplink data transmission" in IE "Cell update cause".

After step 7, UE shall transmit MEASUREMENT REPORT message to SS using AM RLC on DCCH.

### ~~8.3.1.6 Cell Update: UL data transmission in CELL\_PCH~~

#### ~~8.3.1.6.1 Definition~~

#### ~~8.3.1.6.2 Conformance requirement~~

~~This procedure is to update UTRAN with the current cell of the UE if the UE wants to transmit uplink data when the UE is in CELL\_PCH state.~~

#### ~~Reference~~

~~3GPP TS 25.331 clause 8.3.1~~

#### ~~8.3.1.6.3 Test purpose~~

~~To confirm that the UE executes a cell update procedure when the UE transmits uplink data if the UE is in CELL\_PCH state.~~

#### ~~8.3.1.6.4 Method of test~~

#### ~~Initial Condition~~

~~System Simulator: 1 cell~~

~~UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.~~

#### ~~Test Procedure~~

~~The UE is in the CELL\_FACH state. SS sends a MEASUREMENT CONTROL message to trigger UE to measure the CPICH RSCP in a intra-frequency measurement and to report periodically by the MEASUREMENT REPORT message using UM RLC. UE shall send a MEASUREMENT REPORT message to SS using UM RLC on DCCH. SS then transmits a RADIO BEARER RELEASE message with IE "RRC State Indicator" is set to "CELL\_PCH". The UE shall reply with RADIO BEARER RELEASE COMPLETE message and move to CELL\_PCH state. UE shall detect that the periodical timer for measurement reporting has elapsed and attempt to transmit a MEASUREMENT REPORT message. The UE then moves to CELL\_FACH state and transmits a CELL UPDATE message to the SS on the uplink CCCH, with the IE "Cell update-cause" set to value "uplink data transmission". After receiving such a message, SS transmits a CELL UPDATE CONFIRM message. The UE shall stay in CELL\_FACH state and transmit a MEASUREMENT REPORT message using UM RLC on DCCH.~~

| RB information to release list                                    |                                    |
| —RB identity                                                      | 20 or 21 (for radio access bearer) |
| RB information to be affected list                                | Not Present                        |
| UL Transport channel information common for all transport channel | Not Present                        |
| Deleted TrCH information list                                     | Not Present                        |
| Added or Reconfigured UL TrCH information list                    | Not Present                        |
| DL Transport channel information common for all transport channel | Not Present                        |
| Deleted TrCH information list                                     | Not Present                        |
| Added or Reconfigured UL TrCH information list                    | Not Present                        |
| CHOICE channel requirement                                        | Not Present                        |
| Downlink information per radio link list                          | Not Present                        |

## CELL UPDATE (Step 6)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'uplink data transmission' |

#### ~~CELL UPDATE CONFIRM (Step 7)~~

Use the same message sub-type found in Annex A.

#### ~~MEASUREMENT REPORT (Step 3 and 8)~~

Only the message type IE in this message will be checked.

#### ~~RADIO BEARER RELEASE COMPLETE (Step 5)~~

Only the message type IE in this message will be checked.

#### ~~8.3.1.6.5 Test requirement~~

After step 2, UE shall transmit a MEASUREMENT REPORT message to SS using UM RLC on DCCH when 64 seconds has elapsed since the acknowledgement of MEASUREMENT CONTROL message.

After step 4, UE shall transmit a RADIO BEARER RELEASE COMPLETE message and move to CELL\_PCH state.

After step 5, the UE shall move to CELL\_FACH state to initiate a cell update procedure and transmits a CELL UPDATE message which is set to "uplink data transmission" in IE "Cell update cause".

After step 7, UE shall transmit a MEASUREMENT REPORT message to SS using UM RLC on DCCH.

#### ~~8.3.1.7 Void~~

#### ~~8.3.1.8 Void~~

#### ~~8.3.1.9 Cell Update: re-entering of service area after T305 expiry and being out of service area~~

##### ~~8.3.1.9.1 Definition~~

##### ~~8.3.1.9.2 Conformance requirement~~

When a UE detects that it's out of service area after experiencing a T305 timer expiry, it shall try to search for a suitable cell to camp on. At the same time, it shall start timer T307. If the UE subsequently re-enters the service area of a cell before T307 expires, it shall perform a cell update procedure.

#### ~~Reference~~

3GPP TS 25.331 clause 8.3.1

##### ~~8.3.1.9.3 Test purpose~~

To confirm that the UE performs a cell search after experiencing an "out of service area" condition following the expiry of timer T305. To confirm that the UE initiates cell updating procedure if it manages to re-enter the service area.

8.3.1.9.4 Method of test

Initial Condition

System Simulator: 1 cell.

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.

Test Procedure

Table 8.3.1.9

| Parameter              | Unit        | Cell 1 |     |
|------------------------|-------------|--------|-----|
|                        |             | T0     | T1  |
| UTRA-RF Channel Number |             | Ch. 1  |     |
| CPICH Ec               | dBm/3.84MHz | -60    | -80 |

Table 8.3.1.9 illustrates the downlink power to be applied at various time instants of the test execution. Columns marked "T0" denote the initial conditions.

The UE is in the CELL\_FACH state. The content of the SYSTEM INFORMATION BLOCK TYPE 3 and 4 is modified. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.1.9 so that  $S < 0$ . Following the expiry of periodic cell updating timer T305 according to the system information, the UE shall detect that it is out of service area. Within the time interval equivalent to T307 timer value, SS configures its downlink transmission power settings according to columns "T0" in table 8.3.1.9 so that  $S > 0$ . The UE shall find that it is back in service area, and transmit a CELL UPDATE message to the SS on the uplink CCCH. In this message, the IE "Cell update-cause" shall be set to "re-entered service area". After the SS receives this message, it transmits a CELL UPDATE CONFIRM message with the IE "RRC State Indicator" set "CELL\_PCH" on the downlink DCCH. The UE shall enter CELL\_PCH state. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.1.9 so that  $S < 0$ . Following the expiry of periodic cell updating timer T305 according to the system information, the UE shall detect that it is out of service area. Within the time interval equivalent to T307 timer value, SS configures its downlink transmission power settings according to columns "T0" in table 8.3.1.9 so that  $S > 0$ . The UE shall find that it is back in service area, move to CELL\_FACH and transmits a CELL UPDATE message to the SS on the uplink CCCH. In this message, the IE "Cell update-cause" shall be set to "re-entered service area". After the SS receives this message, it transmits a CELL UPDATE CONFIRM message on the downlink DCCH.

## Expected sequence

| 9    |           | →  | CELL UPDATE                                                          | UE shall move to CELL_FACH. It shall transmit this message with cell update cause set to "re-entered service area"                                                    |
| 10   |           | ←  | CELL UPDATE CONFIRM                                                  |                                                                                                                                                                       |

## Specific Message Contents

## MASTER INFORMATION BLOCK (Step 1a)

Use the same message sub-type found in clause 6.1 of TS 34.108, with the following exception:

| Information Element | Value/remark |
|---------------------|--------------|
| MIB Tag             | 2            |

## SYSTEM INFORMATION BLOCK TYPE 3 and 4 (Step 1a)

Use the same message sub-type found in clause 6.1 of TS 34.108, with the following exception:

| Information Element | Value/remark |
|---------------------|--------------|
| Qrxlevmin           | -70          |

#### SYSTEM INFORMATION CHANGE INDICATION (Step 1b)

| Information Element                                     | Value/remark |
|---------------------------------------------------------|--------------|
| Message Type<br>BCCH modification info<br>MIB Value tag | 2            |

#### CELL UPDATE (Step 5 and 9)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element                                      | Value/remark                                                                                                                                     |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| U-RNTI<br>-SRNC Identity<br>-S-RNTI<br>Cell Update Cause | Check to see if set to '0000-0000-0001'<br>Check to see if set to '0000-0000-0000-0000-0001'<br>Check to see if set to 're-entered service area' |

#### CELL UPDATE CONFIRM (Step 6 and 10)

Use the same message sub-type found in Annex A, with the following exception:

| Information Element | Value/remark |
|---------------------|--------------|
| RRC State Indicator | CELL_PCH     |

#### 8.3.1.9.5 Test requirement

After step 4 the UE shall transmit a CELL UPDATE message in which the IE "Cell update cause" is set to the value "re-entered service area".

After step 8 the UE shall move to CELL\_FACH and then transmit a CELL UPDATE message, with the IE "Cell Update Cause" set to "re-entered service area".

#### 8.3.1.10 Cell Update: expiry of T307 after T305 expiry and being out of service area

##### 8.3.1.10.1 Definition

##### 8.3.1.10.2 Conformance requirement

This procedure is required to cater for the case of a failure to update UTRAN with the current cell, after the expiry of T307. In this case, the UE shall return to idle mode and perform cell reselection if possible.

#### Reference

3GPP TS 25.331 clause 8.3.1

##### 8.3.1.10.3 Test purpose

To confirm that the UE moves to idle mode after the expiry of T307, indicating that it is out of service area when attempting to perform a periodic cell updating procedure.

8.3.1.10.4 Method of test

Initial Condition

System Simulator: 1 cell

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.

Test Procedure

Table 8.3.1.10

| Parameter              | Unit        | Cell 1 |     |
|------------------------|-------------|--------|-----|
|                        |             | T0     | T1  |
| UTRA-RF Channel Number |             | Ch. 1  |     |
| CPICH Ec               | dBm/3.84MHz | -60    | -80 |

Table 8.3.1.10 illustrates the downlink power to be applied at various time instants of the test execution. Columns marked "T0" denote the initial conditions.

The UE is in CELL\_FACH state at the start of the test. Before the expiry of periodic cell updating timer T305, the content of the SYSTEM INFORMATION BLOCK TYPE 3 and 4 is modified. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.1.10 so that  $S < 0$  and this results in a "out of service area" condition. The SS continues to listen to the uplink channel to detect possible attempts to perform a cell updating procedure. The UE shall not send any CELL\_UPDATE message on the uplink DCCH, instead it triggers timer T307 and T305. After the expiry of timer T307 and SS configures its downlink transmission power settings according to columns "T0" in table 8.3.1.10 so that  $S > 0$ , the UE shall enter idle state. This is confirmed by the SS when it sends a PAGING TYPE 1 message to the UE using UE identity, and the UE shall respond to the message.

## Expected sequence

| Step | Direction |    | Message                                                              | Comment                                                                                                                                                                                                                                                                                        |

## 8.3.1.10.5 ——— Test requirement

After step 4 the UE shall transmit a RRC CONNECTION REQUEST message to respond to a PAGING TYPE 1 message.

## 8.3.1.11 ——— Cell Update: Success after T302 time-out

## 8.3.1.11.1 ——— Definition

## 8.3.1.11.2 ——— Conformance requirement

The UE transmits a CELL UPDATE message to the UTRAN when it needs to update the UTRAN with the current cell of the UE. When the UE does not receive a CELL UPDATE CONFIRM message upon expiry of timer T302, the UE transmits a CELL UPDATE message repeatedly until its internal counter V302 counter is greater than N302.

## Reference

3GPP TS 25.331 clause 8.3.1

## 8.3.1.11.3 ——— Test purpose

To confirm that the UE repeats the transmission of CELL UPDATE message after failing to receive any response from the SS before T302 timer expires.

## 8.3.1.11.4 ——— Method of test

## Initial Condition

System Simulator: 1 cell

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.

## Test Procedure

At the start of the test, the UE is brought to CELL\_FACH state. When the UE detects the expiry of periodic cell updating timer T305 according to the system information, the UE transmits a CELL UPDATE message to the SS on the uplink CCCH. The IE "Cell update cause" in this message shall be set to "periodical cell update". SS ignores this message, and the UE shall then re-transmit a CELL UPDATE message after the expiry of timer T302. When the SS has

received (N302+1) such messages, it transmits a CELL UPDATE CONFIRM message with new values for "C-RNTI" to the UE. Finally, the UE shall transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.

#### Expected sequence

| Step | Direction |    | Message                            | Comment                                                                                                                                                |
|------|-----------|----|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                    |                                                                                                                                                        |
| 1    |           |    |                                    | The UE starts from CELL_FACH state. SS initializes its internal counter K to 0 and waits until the expiry of T305 timer.                               |
| 2    |           | →  | CELL UPDATE                        | The value "periodical cell update" shall be set in IE "Cell update cause".                                                                             |
| 3    |           |    |                                    | If K is equal to N302 then proceeds to step 5.                                                                                                         |
| 4    |           |    |                                    | SS increments counter K, transmits no response to the UE and waits for an additional period equal to the value of timer T302. The next step is step 2. |
| 5    |           | ←  | CELL UPDATE CONFIRM                | The message includes IEs "new C-RNTI". The IE "RRC State Indicator" is set to "CELL_FACH".                                                             |
| 6    |           | →  | UTRAN MOBILITY INFORMATION CONFIRM |                                                                                                                                                        |

#### Specific Message Contents

##### CELL UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'Periodic cell updating'   |

##### CELL UPDATE CONFIRM (Step 5)

Use the same message sub-type found in Annex A, with the following exception:

| Information Element | Value/remark                                                    |
|---------------------|-----------------------------------------------------------------|
| New C-RNTI          | Set to an arbitrary string different from '0000-0000-0000-0001' |

#### 8.3.1.11.5 Test requirement

After step 1 the UE shall detect the expiry of timer T305 then transmit a CELL UPDATE message on the uplink CCCH, setting "periodical cell update" into IE "Cell update cause".

After step 2 the UE shall re-transmits a CELL UPDATE message after the expiry of timer T302. A total of (N302+1) transmissions of CELL UPDATE message shall be detected in SS.

After step 5 the UE shall transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH and stay at CELL\_FACH state.

### ~~8.3.1.12 Cell Update: Failure (After Maximum Re-transmissions)~~

#### ~~8.3.1.12.1 Definition~~

#### ~~8.3.1.12.2 Conformance requirement~~

The UE transmits a CELL\_UPDATE message to the UTRAN when it needs to update UTRAN with information on the current cell of the UE. If the UE fails to receive a CELL\_UPDATE\_CONFIRM message, it re-transmits a CELL\_UPDATE message repeatedly upon the expiry of timer T302 until the value of V302 counter is greater than N302. If V302 is greater than N302, the UE stop the re-transmission and enters idle state.

3GPP TS 25.331 clause 8.3.1

#### ~~8.3.1.12.3 Test purpose~~

To confirm that the UE repeats the cell update procedure upon the expiry of timer T302 and moves to idle state when its internal counter V302 is greater than N302.

#### ~~8.3.1.12.4 Method of test~~

#### Initial Condition

System Simulator: 1 cell

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.

#### Test Procedure

The UE is initially in CELL\_FACH state. When the UE detects the expiry of periodic cell updating timer T305, the UE transmits a CELL\_UPDATE message to the SS on the uplink CCCH to perform a periodic cell updating procedure. The SS ignores this message, and the UE shall attempt to re-transmit a CELL\_UPDATE message up to a maximum of (N302+1) times after the expiry of timer T302. After (N302) attempts of retransmission, the UE shall return to idle state. SS transmits a PAGING TYPE 1 message with UE's identity. UE shall respond with a RRC CONNECTION REQUEST message.

## Expected sequence

| Step | Direction |    | Message     | Comment                                                                                                                                          |
|------|-----------|----|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |             |                                                                                                                                                  |
| 1    |           |    |             | The UE is in the CELL_FACH state. SS sets its internal counter K=0 and waits for a period equals to timer value T305.                            |
| 2    |           | →  | CELL UPDATE | The value "periodical cell update" shall be set in IE "Cell update cause".                                                                       |
| 3    |           |    |             | SS transmits no response to the UE and increments counter K.                                                                                     |
| 4    |           |    |             | SS waits for an additional period equal to T302 timer and if K is not greater than N302, then next step is step 2. Else the next step is step 5. |
| 5    |           |    |             | The UE shall enter idle mode state.                                                                                                              |

## Specific Message Contents

## CELL UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'Periodic cell updating'   |

## 8.3.1.12.5 Test requirement

After step 1 the UE shall transmit a CELL UPDATE message on the uplink CCCH and set value "periodical cell update" into IE "Cell update cause".

After step 3 and if K is not greater than N302, the UE shall retry to transmit a CELL UPDATE message.

## 8.3.1.13 Cell Update: Reception of Invalid CELL UPDATE CONFIRM Message

## 8.3.1.13.1 Definition

## 8.3.1.13.2 Conformance Requirement

If the UE encounters an invalid CELL UPDATE CONFIRM message while executing a cell update procedure, it shall check the current value of its internal counter V302. If V302 is not greater than N302, the UE shall set contexts pertaining to protocol error, re-transmits a CELL UPDATE message on uplink CCCH, restart T302 timer and increments V302. It shall use the same "Cell Update Cause" as before receiving the invalid downlink message.

## 8.3.1.13.3 Test Purpose

To confirm that the UE retransmits a CELL UPDATE message when it receives an invalid CELL UPDATE CONFIRM message, before the number of retransmissions has reached the maximum allowed value.

### 8.3.1.13.4 Method of Test

#### Initial Condition

System Simulator: 1 cell

UE: CELL\_PCH (state 6-12) as specified in clause 7.4 of TS 34.108.

#### Test Procedure

The UE is brought to CELL\_PCH state at the beginning of the test. SS pages the UE by sending a PAGING TYPE 1 message using the U-RNTI identity assigned during RRC connection establishment procedure. The UE shall transmit a CELL\_UPDATE message on the uplink CCCH. Upon receiving such a message, the SS replies with an invalid CELL\_UPDATE\_CONFIRM message on downlink DCCH using UM RLC. The UE shall detect the protocol error and re-transmit a CELL\_UPDATE message up to a maximum of N302 times. SS then transmit a valid CELL\_UPDATE\_CONFIRM message.

#### Expected Sequence

| Step | Direction |    | Message             | Comment                                                                                                                                                                                                                        |
|------|-----------|----|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                     |                                                                                                                                                                                                                                |
| 1    |           | ←  | PAGING TYPE 1       | The UE is in the CELL_PCH state. SS pages for the UE using the allocated connected mode identity (U-RNTI).                                                                                                                     |
| 2    |           | →  | CELL_UPDATE         | Check that the value "paging response" is set in IE "Cell update cause".                                                                                                                                                       |
| 3    |           | ←  | CELL_UPDATE_CONFIRM | See specific message content.                                                                                                                                                                                                  |
| 4    |           | →  | CELL_UPDATE         | Check that the value "paging response" is set in IE "Cell update cause", the value "protocol error" is set in IE "failure cause" and the value "ASN.1 violation and encoding error" is set in IE "Protocol error information". |
| 5    |           | ←  | CELL_UPDATE_CONFIRM | Use the default message found in Annex A.                                                                                                                                                                                      |

#### Specific Message Content

##### CELL\_UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| –SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| –S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'Paging Response'          |

##### CELL\_UPDATE\_CONFIRM (Step 3)

| Information Element | Value/remark |
|---------------------|--------------|
| All IEs             | Not Present  |

### CELL UPDATE (Step 4)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element         | Value/remark                                                      |
|-----------------------------|-------------------------------------------------------------------|
| U-RNTI                      | Check to see if set to '0000-0000-0001'                           |
| -SRNC Identity              | Check to see if set to '0000-0000-0000-0000-0001'                 |
| -S-RNTI                     | Check to see if set to 'Paging-Response'                          |
| Cell Update Cause           | Check to see if it is set to 'protocol-error'                     |
| Failure cause               | Check to see if it is set to "ASN.1 violation and encoding error" |
| —Protocol error information |                                                                   |

### PAGING TYPE 1 (Step 1)

Use the same message sub-type titled "TM (Packet in PS)" in default message content of TS 34.108 with following exceptions:

| Information Element          | Value/remark               |
|------------------------------|----------------------------|
| Page record list             |                            |
| -Paging record               |                            |
| -CHOICE Used paging identity | UTRAN-identity             |
| -U-RNTI                      |                            |
| -SRNC Identity               | '0000-0000-0001'           |
| -S-RNTI                      | '0000-0000-0000-0000-0001' |

### 8.3.1.13.5 — Test Requirement

After step 1 the UE shall transmit a CELL UPDATE message on the uplink CCCH, setting "paging response" into IE "Cell update cause".

After step 3 the UE shall transmit a CELL UPDATE message on the uplink CCCH, setting "paging response" into IE "Cell update cause", "protocol-error" into IE "failure cause" and "ASN.1 violation or encoding error" into IE "Protocol error information".

### 8.3.1.14 — Cell Update: Incompatible simultaneous reconfiguration

#### 8.3.1.14.1 — Definition

#### 8.3.1.14.2 — Conformance Requirement

If the UE encounters a CELL UPDATE CONFIRM message that includes "Physical channel information elements" and UE's variable ORDERED\_RECONFIGURATION is set to TRUE because of an ongoing Reconfiguration procedure, it shall check the current value of its internal counter V302. If V302 is not greater than N302, the UE shall set IE "failure cause" to "Incompatible simultaneous reconfiguration", re-transmits a CELL UPDATE message on uplink CCCH, restart T302 timer and increments V302. It shall use the same "Cell Update-Cause" as before receiving the downlink message.

#### 8.3.1.14.3 — Test Purpose

To confirm that the UE retransmits a CELL UPDATE message when it receives a CELL UPDATE CONFIRM message that includes "Physical channel information elements" and UE's variable ORDERED\_RECONFIGURATION is set to TRUE because of an ongoing Reconfiguration procedure, before the number of retransmissions has reached the maximum allowed value.

#### 8.3.1.14.4 Method of Test

##### Initial Condition

System Simulator: 1 cell

UE: CELL\_PCH (state 6-12) as specified in clause 7.4 of TS 34.108.

##### Test Procedure

The UE is brought to CELL\_PCH state at the beginning of the test. SS pages the UE by sending a PAGING TYPE 1 message using the U-RNTI identity assigned during RRC connection establishment procedure. The UE shall transmit a CELL UPDATE message on the uplink CCCH. Upon receiving such a message, the SS replies with a CELL UPDATE CONFIRM message contains IE "Physical channel information elements". Following that, SS immediately transmits another CELL UPDATE CONFIRM message contains IE "Physical channel information elements" before the "activation time" indicated in the previous CELL UPDATE CONFIRM message expires. The UE shall re-transmit a CELL UPDATE message with the same cause as the previous CELL UPDATE message and failure cause as "Incompatible simultaneous reconfiguration". SS then transmits a CELL UPDATE message to end the procedure.

##### Expected Sequence

| Step | Direction |    | Message             | Comment                                                                         |
|------|-----------|----|---------------------|---------------------------------------------------------------------------------|
|      | UE        | SS |                     |                                                                                 |
| 1    |           | ←  | PAGING TYPE 1       |                                                                                 |
| 2    |           | →  | CELL UPDATE         |                                                                                 |
| 3    |           | ←  | CELL UPDATE CONFIRM | SS transmits this message including IE "Physical channel information elements". |
| 4    |           | ←  | CELL UPDATE CONFIRM | Sent before the activation time specified in the message in step 3 has elapsed. |
| 5    |           | →  | CELL UPDATE         |                                                                                 |
| 6    |           | ←  | CELL UPDATE CONFIRM |                                                                                 |

##### Specific Message Content

##### CELL UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'Paging Response'          |

##### CELL UPDATE (Step 5)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                                       |
|---------------------|--------------------------------------------------------------------|
| U-RNTI              |                                                                    |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'                            |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001'                  |
| Cell Update Cause   | Check to see if set to 'Paging Response'                           |
| Failure cause       | Check to see if set to 'Incompatible simultaneous reconfiguration' |

**CELL UPDATE CONFIRM (Step 3)**

Use the same message sub-type found in Annex A, with the following exception:

| Information Element         | Value/remark                        |
|-----------------------------|-------------------------------------|
| Activation Time Info        | Current CFN-[current CFN mod 8 + 8] |
| Maximum allowed UL TX power | 30dBm                               |

**CELL UPDATE CONFIRM (Step 4)**

Use the same message sub-type found in Annex A, with the following exception:

| Information Element         | Value/remark                        |
|-----------------------------|-------------------------------------|
| Activation Time Info        | Current CFN-[current CFN mod 8 + 8] |
| Maximum allowed UL TX power | 25dBm                               |

**PAGING TYPE 1 (Step 1)**

Use the same message sub-type titled "TM (Packet in PS)" in default message content of TS 34.108 with following exceptions:

| Information Element           | Value/remark               |
|-------------------------------|----------------------------|
| Page record list              |                            |
| → Paging record               |                            |
| → CHOICE Used paging identity | UTRAN identity             |
| → U-RNTI                      |                            |
| → SRNC Identity               | '0000-0000-0001'           |
| → S-RNTI                      | '0000-0000-0000-0000-0001' |

**8.3.1.14.5 ——— Test Requirement**

After step 1, UE shall transmit a CELL UPDATE message.

After step 4 the UE shall re-transmit a CELL UPDATE message with failure cause set to "Incompatible simultaneous reconfiguration".

**8.3.1.15 ——— Cell Update: Unrecoverable error in Acknowledged Mode RLC****8.3.1.15.1 ——— Definition****8.3.1.15.2 ——— Conformance Requirement**

In CELL\_FACH, the UE shall ensure that all AM RLC entities (both signalling and u-plane links) are operational. In the event that an unrecoverable error has occurred, the UE shall trigger cell update procedure to report this event. The UE shall send a CELL UPDATE message on the uplink CCCH and set the appropriate AM\_RLC error indicator IE(s) to TRUE. After receiving the CELL UPDATE CONFIRM message, the UE shall reset the affected AM RLC entities and then resume transmission and reception activities.

**Reference**

3GPP TS 25.331 clause 8.3.1

**8.3.1.15.3 ——— Test Purpose**

To confirm that the UE reports the occurrence of an unrecoverable error in a C-plane AM RLC entity by initiating cell update procedure. To confirm that the UE is able to resume normal C-plane data transmission and reception after the completion of cell update procedure.

#### 8.3.1.15.4 Method of Test

##### Initial Condition

System Simulator: 1 cell

UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE

##### Test Procedure

The UE is initially in CELL\_DCH state. SS sends a UE CAPABILITY ENQUIRY message on the DCCH using AM mode. The UE shall reply with a UE CAPABILITY INFORMATION message, sent using AM RLC on the DCCH. SS does not acknowledge the AM PDUs carrying this message. The UE shall continue to re-transmit the AM PDU carrying UE CAPABILITY INFORMATION message until the maximum re-transmission count is reached. Thereafter, the UE shall start sending RESET PDUs to request that the AM RLC entity for RRC signalling be re-initialized. SS ignores the requests and wait for a duration equivalent to (MAX\_RST+1) times expiry of Timer\_RST. At this point, the UE shall initiate a cell update procedure by transmitting a CELL UPDATE message on the uplink CCCH. The CELL UPDATE message shall specify the value "TRUE" in IE "AM\_RLC error indicator (RB2 or RB3)" and "RLC unrecoverable error" as the cell update cause. SS replies with CELL UPDATE CONFIRM message with IE "RLC re-establish indicator (RB2 and RB3)" set to TRUE. SS then attempts to perform a local authentication by transmitting a UE CAPABILITY ENQUIRY message using AM RLC on DCCH. The UE shall respond by sending a UE CAPABILITY INFORMATION message on the uplink DCCH, verifying that the AM RLC entity for RRC signalling was successfully reset. SS shall transmit a UE CAPABILITY INFORMATION CONFIRM message to UE to end the test.

##### Specific Message Contents

##### UE CAPABILITY ENQUIRY (Step 2 and 7)

Use the same message found in Annex A.

**UE CAPABILITY INFORMATION (Step 3 and 8)**

Only the message type IE is checked for this message.

**CELL UPDATE (Step 5)**

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element                 | Value/remark                                      |
|-------------------------------------|---------------------------------------------------|
| U-RNTI                              |                                                   |
| -SRNC Identity                      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI                             | Check to see if set to '0000-0000-0000-0000-0001' |
| AM_RLC error indicator (RB2 or RB3) | Check to see if set to 'TRUE'                     |
| Cell update cause                   | RLC unrecoverable error                           |

**CELL UPDATE CONFIRM (Step 6)**

Use the same message found in Annex A, with the following exception.

| Information Element                      | Value/remark |
|------------------------------------------|--------------|
| RLC re-establish indicator (RB2 and RB3) | 'TRUE'       |

**UE CAPABILITY INFORMATION CONFIRM (Step 9)**

Use the same message found in Annex A.

**8.3.1.15.5 ——— Test Requirement**

After step 4 the UE shall transmit a CELL UPDATE message on the uplink CCCH to report the occurrence of an unrecoverable error in AM RLC entity for RB2 or RB3 data as well as cell update cause set to "RLC unrecoverable error".

After step 7 the UE shall send a UE CAPABILITY INFORMATION message on the uplink DCCH. This message shall be sent using the AM RLC entity for RRC signalling.

**8.3.1.16 ——— Void****8.3.1.17 ——— Cell Update: Failure (UTRAN initiate an RRC connection release procedure on CCCH)****8.3.1.17.1 ——— Definition****8.3.1.17.2 ——— Conformance requirement**

The UE transmits a CELL UPDATE message to the UTRAN when it needs to update UTRAN with information on the current cell of the UE. If the UE receives a RRC CONNECTION RELEASE message on CCCH, it shall release all its radio resources and enter idle mode.

**Reference**

3GPP TS 25.331 clause 8.3.1

**8.3.1.17.3 ——— Test purpose**

To confirm that the UE moves to idle state upon the reception of RRC CONNECTION RELEASE message on DCCH.

#### 8.3.1.17.4 Method of test

##### Initial Condition

System Simulator: 1 cell

UE: PS-DCCH+DTCH\_FACH (state 6-11)

##### Test Procedure

The UE is initially in CELL\_FACH state. When the UE detects the expiry of periodic cell updating timer T305, the UE transmits a CELL\_UPDATE message to the SS on the uplink CCCH to perform a periodical cell updating procedure. The SS transmits a RRC CONNECTION RELEASE message on downlink CCCH. The UE shall return to idle mode after release of all current signalling flows and radio access bearers. SS verifies that UE is in idle mode state by paging the UE with CN identity, in which case the UE shall attempt to establish a RRC connection.

##### Expected sequence

| Step | Direction |    | Message                | Comment                                                                                                                             |
|------|-----------|----|------------------------|-------------------------------------------------------------------------------------------------------------------------------------|

| Paging record               |                                                     |
| CHOICE Used paging identity | CN identity                                         |
| → Paging cause              | Terminating Call with one of the supported services |
| → CN domain identity        | Supported Domain (PS Domain or CS Domain)           |
| → CHOICE UE Identity        | IMSI                                                |
| → IMSI                      | Set to the IMSI value stored in the TEST USIM card. |

#### 8.3.1.17.5 ——— Test requirement

In step 1 the UE shall transmit a CELL UPDATE message on the uplink CCCH and set value "periodical cell update" into IE "Cell update cause".

After step 5 the UE transmit a RRC CONNECTION REQUEST message.

#### 8.3.1.18 ——— Cell Update: Radio Link Failure (T314>0, T315=0)

##### 8.3.1.18.1 ——— Definition

##### 8.3.1.18.2 ——— Conformance requirement

When a UE loses the radio connection due to e.g. radio link failure in CELL\_DCH state, UE must release the radio bearer which is associated with T315 if T315 is set to 0. After a successful cell re-selection and subsequent transition to CELL\_FACH state, the UE transmits CELL UPDATE message on the uplink CCCH.

If the UE failed to establish the physical channel(s) indicated in the received CELL UPDATE CONFIRM message and the maximum allowable number of retransmission has not been reached, the UE shall select a suitable UTRA cell and transmit a CELL UPDATE message.

#### Reference

3GPP TS 25.331 clause 8.3.1

##### 8.3.1.18.3 ——— Test purpose

To confirm that the UE shall indicate to the non-access stratum the release of radio access bearer which is associated with T315 and try to find a new cell after detecting that a radio link failure has occurred.

To confirm that the UE performs a cell selection procedure when it fails to configure the physical channel(s) indicated in the CELL UPDATE CONFIRM message.

##### 8.3.1.18.4 ——— Method of test

#### Initial Condition

System Simulator: 2 cells (Cell 1 is active, Cell 2 is inactive).

UE: CS\_DCCH+DTCH\_DCH (state 6-9) or PS\_DCCH+DTCH\_DCH (state 6-10) in cell 1, depending on the CN domain(s) supported by the UE.

## Test Procedure

Table 8.3.1.18

| Parameter              | Unit        | Cell 1 |     | Cell 2 |     |
|------------------------|-------------|--------|-----|--------|-----|
|                        |             | T0     | T1  | T0     | T1  |
| UTRA-RF Channel Number |             | Ch. 1  |     | Ch. 1  |     |
| CPICH-Ec               | dBm/3.84MHz | -60    | OFF | -75    | -60 |

Table 8.3.1.18 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions.

The UE is brought to CELL\_DCH state in a cell 1 after making a successful outgoing call attempt. After the call has been established, SS transmits UTRAN MOBILITY INFORMATION message to UE to change to value of T315 timer. UE shall respond with a UTRAN MOBILITY INFORMATION CONFIRM message. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.1.18. The UE shall detect a radio link failure in cell 1 and indicate to the non-access stratum the release of the radio bearer which is associated with T315. Then it shall attempt to re-select to cell 2. After that, it shall then enter CELL\_FACH state and transmit CELL UPDATE on the uplink CCCH to SS. The SS transmits CELL UPDATE CONFIRM message which includes dedicated physical channel parameters. SS shall not configure according to this message and its downlink transmission power settings according to columns "T0" in table 8.3.1.18. UE shall fail to establish the dedicated channel in cell 2. UE shall re-select to cell 1 and transmit a CELL UPDATE message with IE "Cell update cause" set to "Radio link failure". Then SS responds with a CELL UPDATE CONFIRM message to end the procedure.

| 7    | →         |    | CELL UPDATE                        | The UE shall find a new cell 2 and the value "radio link failure" shall be set in IE "Cell update cause".                                        |
| 8    | ←         |    | CELL UPDATE CONFIRM                | Including dedicated physical channel parameters.                                                                                                 |
| 9    |           |    |                                    | SS does not configure according to the message in step 8. SS configures cell 1 and 2 according to column "T0" in table 8.3.1.18.                 |
| 10   | →         |    | CELL UPDATE                        | UE shall select cell 1 and enter CELL_FACH state to transmit this message                                                                        |
| 11   | ←         |    | CELL UPDATE CONFIRM                |                                                                                                                                                  |

## Specific Message Contents

## UTRAN MOBILITY INFORMATION (Step 1)

The contents of UTRAN MOBILITY INFORMATION message in this test case is identical to those in Annex A with the following exceptions:

| Information Element                                   | Value/remark |
|-------------------------------------------------------|--------------|
| New U-RNTI                                            | Not Present  |
| New C-RNTI                                            | Not Present  |
| UE Timers and constants in connected mode<br>——→ T315 | 0            |

## CELL UPDATE (Step 7)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                     |
|---------------------|--------------------------------------------------|
| U-RNTI              |                                                  |
| ——→ SRNC Identity   | Check to see if set to value assigned in cell 2. |
| —S-RNTI             | Check to see if set to value assigned in cell 2. |
| Cell Update Cause   | Check to see if set to 'radio link failure'      |

## CELL UPDATE CONFIRM (Step 8)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element        | Value/remark                                                                    |
|----------------------------|---------------------------------------------------------------------------------|
| CHOICE channel requirement | Same as the set defined in the RADIO BEARER SETUP message in initial condition. |

## CELL UPDATE (Step 10)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                     |
|---------------------|--------------------------------------------------|
| U-RNTI              |                                                  |
| ——→ SRNC Identity   | Check to see if set to value assigned in cell 1. |
| —S-RNTI             | Check to see if set to value assigned in cell 1. |
| Cell Update Cause   | Check to see if set to 'radio link failure'      |

## 8.3.1.18.5 ————— Test requirement

After step 1, the UE shall transmit UTRAN MOBILITY INFORMATION CONFIRM message.

After step 6, the UE shall detect the presence of cell 2, perform cell re-selection and transmit a CELL UPDATE message.

After step 9, the UE shall transmit a CELL UPDATE message with IE "Cell update cause" set to "Radio link failure".

~~8.3.1.19 Void~~~~8.3.1.20 Cell Update: Reception of CELL UPDATE CONFIRM Message that causes invalid configuration~~~~8.3.1.20.1 Definition~~~~8.3.1.20.2 Conformance Requirement~~

If the UE encounters a CELL UPDATE CONFIRM message that set the variable INVALID\_CONFIGURATION to TRUE while executing a cell update procedure, it shall check the current value of its internal counter V302. If V302 is not greater than N302, the UE shall set IE "failure cause" to "invalid configuration", re-transmit a CELL UPDATE message on uplink CCCH, restart T302 timer and increment V302. It shall use the same "Cell Update Cause" as before receiving the erroneous downlink message.

~~8.3.1.20.3 Test Purpose~~

To confirm that the UE retransmits a CELL UPDATE message when it receives a CELL UPDATE CONFIRM message that will trigger an invalid configuration in the UE, if the number of retransmissions has not reached the maximum allowed value.

~~8.3.1.20.4 Method of Test~~~~Initial Condition~~

System Simulator: 1 cell

UE: CELL\_PCH (state 6-12) as specified in clause 7.4 of TS 34.108.

~~Test Procedure~~

The UE is brought to CELL\_PCH state at the beginning of the test. SS pages the UE by sending a PAGING TYPE 1 message using the U-RNTI identity assigned during RRC connection establishment procedure. The UE shall transmit a CELL UPDATE message on the uplink CCCH. Upon receiving such a message, the SS replies with a CELL UPDATE CONFIRM message which is set to give an invalid configuration. The UE shall re-transmit CELL UPDATE message. SS responds with a valid CELL UPDATE CONFIRM message to end the procedure.

~~Expected Sequence~~

| Step | Direction |    | Message             | Comment                                                                                                      |
|------|-----------|----|---------------------|--------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                     |                                                                                                              |
| 1    | ←         |    | PAGING TYPE 1       | The UE is in the CELL_PCH state. SS pages for the UE using the allocated connected mode identity (U-RNTI).   |
| 2    | →         |    | CELL UPDATE         | If CELL UPDATE message is received, check that the value "paging response" is set in IE "Cell update cause". |
| 3    | ←         |    | CELL UPDATE CONFIRM | SS transmits an invalid message.                                                                             |
| 4    | →         |    | CELL UPDATE         | IE "failure cause" is set to "invalid configuration"                                                         |
| 5    | ←         |    | CELL UPDATE CONFIRM |                                                                                                              |

## Specific Message Content

## CELL UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause   | Check to see if set to 'Paging Response'          |

## CELL UPDATE CONFIRM (Step 3)

Use the same message sub-type found in Annex A, with the following exception:

| Information Element | Value/remark |
|---------------------|--------------|
| RRC State Indicator | CELL_DCH     |
| Uplink DPCH info    | Not Present  |

## CELL UPDATE (Step 4)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                         |
|---------------------|------------------------------------------------------|
| U-RNTI              |                                                      |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'              |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001'    |
| Cell Update Cause   | Check to see if set to 'Paging Response'             |
| Failure cause       | Check to see if it is set to 'invalid configuration' |

## PAGING TYPE 1 (Step 1)

Use the same message sub-type titled "TM (Packet in PS)" in default message content of TS 34.108 with following exceptions:

| Information Element          | Value/remark               |
|------------------------------|----------------------------|
| Page record list             |                            |
| -Paging record               |                            |
| -CHOICE Used paging identity | UTRAN identity             |
| -U-RNTI                      |                            |
| -SRNC Identity               | '0000-0000-0001'           |
| -S-RNTI                      | '0000-0000-0000-0000-0001' |

## 8.3.1.20.5 Test Requirement

After step 1 the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "paging response".

After step 3 the UE shall transmit a CELL UPDATE message with IE "cell update cause" set to "paging response" and IE "failure cause" set to "invalid configuration".

## 8.3.1.21 Cell Update: Cell reselection to cell of another PLMN belonging to the equivalent PLMN list

## 8.3.1.21.1 Definition

### 8.3.1.21.2 ~~Conformance requirement~~

~~A UE shall initiate the cell update procedure in the following cases:~~

~~1. Cell reselection:~~

- ~~— if none of the criteria for performing cell update with the causes specified above in the current clause is met; and~~
- ~~— if the UE is in CELL\_FACH or CELL\_PCH state; and~~
- ~~— if the UE performs cell re-selection or the variable C\_RNTI is empty:~~
  - ~~— perform cell update using the cause "cell reselection".~~

~~2. A "suitable cell" is a cell on which the UE may camp on to obtain normal service. Such a cell shall fulfil all the following requirements:~~

- ~~— The cell is part of the selected PLMN or, of a PLMN considered as equivalent by the UE according to the information provided by the NAS.~~
- ~~— The cell is not barred, see clause 5.3.4.1.~~
- ~~— The cell is not part of the list of "forbidden LAs for roaming" [9]~~
- ~~— The cell selection criteria are fulfilled, see clause 5.2.3.1.2.~~

~~3. The Mobile Equipment shall store a list of "equivalent PLMNs". This list is replaced or deleted at the end of each location update procedure, routing area update procedure and GPRS attach procedure. The stored list consists of a list of equivalent PLMNs as downloaded by the network plus the PLMN code of the network that downloaded the list. The stored list shall not be deleted when the MS is switched off. The stored list shall be deleted if the SIM is removed. The maximum number of possible entries in the stored list is six.~~

### Reference

~~3GPP TS 25.331 clause 8.3.1.2.~~

~~3GPP TS 25.304 clause 4.3.~~

~~3GPP TS 24.008 clause 4.4.1.~~

### 8.3.1.21.3 ~~Test purpose~~

- ~~1 To confirm that the UE executes a cell update procedure after a successful reselection of another UTRA cell with a PLMN identity different from the original cell but with a PLMN identity that is part of the equivalent PLMN list in the UE. To confirm that the UE sends the correct uplink response message when executing cell update procedure due to cell reselection.~~

~~NOTE: Verifies conformance requirement 1, 2 and 3.~~

- ~~2 To confirm that the UE refrains from executing a cell update procedure to a better UTRA cell with another PLMN identity when that PLMN identity is not part of the equivalent PLMN list in the UE.~~

~~NOTE: Verifies conformance requirement 1, 2 and 3.~~

~~NOTE: Test case in 8.3.1.1 is a test where the UE reselects to a cell with the same PLMN identity as the registered PLMN.~~

### 8.3.1.21.4 ~~Method of test~~

### Initial Condition

System Simulator: 3 cells – Cell 1 is active, with the downlink transmission power shown in column marked "T0" in table 8.3.1.1-1, while cell 2 and cell 3 is inactive.

UE: CS-CELL\_FACH\_Initial (state 6-2) or PS-CELL\_FACH\_Initial (state 6-4) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain(s) supported by the UE.

UE: Shall have stored equivalent PLMN list containing PLMN-1 and PLMN-2. The equivalent PLMN list stored in the UE shall not contain PLMN-3.

### Test Procedure

The SS activates Cell 1-3 according table 8.3.1.21-1.

**Table 8.3.1.21-1**

| Parameter              | Unit | Cell 1 |     |     | Cell 2                 |     |     | Cell 3                 |                        |     |
|------------------------|------|--------|-----|-----|------------------------|-----|-----|------------------------|------------------------|-----|
|                        |      | T0     | T1  | T2  | T0                     | T1  | T2  | T0                     | T1                     | T2  |
| UTRA RF Channel Number |      | Ch. 1  |     |     | Ch. 1                  |     |     | Ch. 1                  |                        |     |
| PLMN identity          |      | PLMN-1 |     |     | PLMN-2                 |     |     | PLMN-3                 |                        |     |
| CPICH RSCP             | dBm  | -73    | -79 | -79 | Cell 2 is switched off | -73 | -79 | Cell 3 is switched off | Cell 3 is switched off | -73 |

Table 8.3.1.21-1 illustrates the downlink power to be applied for the 3 cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions, while columns marked "T1" and "T2" are to be applied subsequently.

- At T0, the SS activates Cell 1.
- At T1, the SS activates Cell 2, and monitors Cell 2 for received messages from UE.
- UE re-selects to Cell 2, and sends a CELL UPDATE
- At T2, the SS activates Cell 3, and monitors Cell 3 for received messages from UE.

### Expected sequence

| Step | Direction |    | Message                            | Comment                                                                              |
|------|-----------|----|------------------------------------|--------------------------------------------------------------------------------------|
|      | UE        | SS |                                    |                                                                                      |
| 1    |           |    |                                    | At T0: UE is camped on Cell 1 and registered to PLMN1                                |
| 2    |           | →  | CELL UPDATE                        | At T1: Sent in Cell 2<br>The value "cell reselection" set in IE "Cell update cause". |
| 3    |           | ←  | CELL UPDATE CONFIRM                |                                                                                      |
| 4    |           | →  | UTRAN MOBILITY INFORMATION CONFIRM |                                                                                      |
| 5    |           |    |                                    | At T2: No message sent by UE                                                         |

### Specific Message Contents

#### CELL UPDATE CONFIRM (Step 4)

Use the same message sub-type titled "CELL UPDATE CONFIRM message" in Annex A with following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| - New C-RNTI        | Present      |
| - URA identity      | Not present  |

#### 8.3.1.21.5 Test requirement

The UE shall send a CELL UPDATE at T1 but refrain from sending a cell update (or any other message) after T2.

### ~~8.3.1.22 Cell update: Restricted cell reselection to a cell belonging to forbidden LA list (CELL\_FACH)~~

#### ~~8.3.1.22.1 Definition~~

#### ~~8.3.1.22.2 Conformance requirement~~

##### ~~1. Cell reselection:~~

- ~~— if none of the criteria for performing cell update with the causes specified above in the current clause is met; and~~
- ~~— if the UE is in CELL\_FACH or CELL\_PCH state; and~~
- ~~— if the UE performs cell re-selection or the variable C\_RNTI is empty:~~
  - ~~— perform cell update using the cause "cell reselection".~~

##### ~~2. A "suitable cell" is a cell on which the UE may camp on to obtain normal service. Such a cell shall fulfil all the following requirements.~~

- ~~— The cell is part of the selected PLMN or, of a PLMN considered as equivalent by the UE according to the information provided by the NAS.~~
- ~~— The cell is not barred, see clause 5.3.4.1.~~
- ~~— The cell is not part of the list of "forbidden LAs for roaming" [9]~~
- ~~— The cell selection criteria are fulfilled, see clause 5.2.3.1.2.~~

##### ~~3. The Mobile Equipment shall contain a list of "forbidden location areas for roaming", as well as a list of "forbidden location areas for regional provision of service". These lists shall be erased when the MS is switched off or when the SIM is removed, and periodically (with period in the range 12 to 24 hours). The location area identification received on the BCCH that triggered the location updating request shall be added to the suitable list whenever a location update reject message is received with the cause "Roaming not allowed in this location area" or with the cause "Location Area not allowed". The lists shall accommodate each 10 or more location area identifications. When the list is full and a new entry has to be inserted, the oldest entry shall be deleted.~~

#### Reference

3GPP TS 25.331 clause 8.3.1.2.

3GPP TS 25.304 clause 4.3.

3GPP TS 24.008 clause 4.4.1.

#### ~~8.3.1.22.3 Test purpose~~

To confirm that the UE executes a cell update procedure after a successful reselection of another UTRA cell with a LA identity that is not part of the list of LAs stored in the UE as "forbidden location areas for roaming". To confirm that if the UE get a release message and is moved to idle mode, performs a location registration where the LA list is updated and the UE again enters connected mode, that the UE refrains from selecting that same UTRA cell if that is part of the forbidden LA list.

NOTE: — Test case in 8.3.1.1 is a test where the UE reselects to a cell with the same LA identity as the LA identity in the original cell.

NOTE: — Test case in 8.1.3.2 is a test where normal RRC connection release on DCCH in CELL\_FACH state is tested.

NOTE: — Test case in 8.1.9 is a test where normal RRC connection request and location registration is tested.

#### 8.3.1.22.4 Method of test

##### Initial Condition

System Simulator: 2 cells – Cell 1 is active, with the downlink transmission power shown in column marked "T0" in table 8.3.2.1-1, while cell 2 is inactive.

UE: CS-CELL\_FACH\_Initial (state 6-2) or PS-CELL\_FACH\_Initial (state 6-4) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain(s) supported by the UE.

UE: Shall have an empty list of LAs stored that are "forbidden location areas for roaming". The UE shall be registered to CS through cell 1 with LA-ID 1.

##### Test Procedure

**Table 8.3.1.22-1**

| Parameter              | Unit | Cell 1  |     | Cell 2                 |     |
|------------------------|------|---------|-----|------------------------|-----|
|                        |      | T0      | T1  | T0                     | T1  |
| UTRA-RF Channel Number |      | Ch. 1   |     | Ch. 1                  |     |
| LA identity            |      | LA-ID 1 |     | LA-ID 2                |     |
| CPICH RSCP             | dBm  | -73     | -79 | Cell 2 is switched-off | -73 |

Table 8.3.1.22-1 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions, while columns marked "T1" and "T2" are to be applied subsequently.

- At T1, verify that the UE reselects to cell 2 and sends a cell update.
- SS sends a RRC connection release message to the UE from cell2.
- The UE performs a location registration to cell 2 (RRC Connection request, setup, initial direct transfer, DL direct transfer (with LA forbidden for roaming), RRC connection release.)
- The UE reselects cell 1 again although this is not the best cell.
- The UE performs a location registration to cell 1 (RRC Connection request, setup, initial direct transfer, DL direct transfer (without LA forbidden for roaming)).
- Keep the UE in RRC Connected mode in CELL\_FACH state.
- Make sure the UE refrains from reselecting cell2 and sends a cell update (or any other message) in cell2.

## Expected sequence

| Step | Direction |    | Message                         | Comment                                                                                                    |
|------|-----------|----|---------------------------------|------------------------------------------------------------------------------------------------------------|

## Specific Message Contents

## FFS

## 8.3.1.22.5 Test requirement

The UE shall send a CELL UPDATE in Cell 2 at T1, attempt Location registration in Cell 2, but, since the location registration is rejected in Cell 2, not send any more messages in Cell 2

## 8.3.1.23 Cell Update: HCS cell reselection in CELL\_FACH

## 8.3.1.23.1 Definition

## 8.3.1.23.2 Conformance requirement

This procedure is used to update UTRAN with the current cell of the UE after it has performed a cell reselection in CELL\_FACH state with HCS parameters applied.

## Reference

3GPP TS 25.331 clause 8.3.1.

3GPP TS 25.304 clause 5.2.6.1.4.

3GPP TS 25.304 clause 5.4.3.

### 8.3.1.23.3 ~~Test purpose~~

To confirm that the UE can read HCS related SIB information and act upon all HCS parameters. To confirm that the UE executes a cell update procedure after the successful reselection of another UTRA cell. To confirm that the UE sends the correct uplink response message when executing cell update procedure due to cell reselection.

### 8.3.1.23.4 ~~Method of test~~

#### Initial Condition

System Simulator: 3 cells—Cell 1 is active with downlink transmission power shown in Column To in Table 8.3.1.21-1. Cell 2 and 3 are switched off.

UE: CS-CELL\_FACH\_Initial (state 6-2) or PS-CELL\_FACH\_Initial (state 6-4) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE

#### Specific Message Content

For system information blocks 3, 4, 11 & 12 for Cell 1 (gives IE's which are different from defaults given in 34.108 sec 6.1) to be transmitted before idle update preamble.

## Test Procedure

Table 8.3.1.21-1

| Parameter              | Unit | Cell 1 |     |     | Cell 2 |     |     | Cell 3 |     |     |
|------------------------|------|--------|-----|-----|--------|-----|-----|--------|-----|-----|
|                        |      | T0     | T1  | T2  | T0     | T1  | T2  | T0     | T1  | T2  |
| UTRA RF Channel Number |      | Ch. 1  |     |     | Ch. 1  |     |     | Ch. 1  |     |     |
| CPICH RSCP             | dBm  | -61    | -61 | -61 | -80    | -80 | -67 | -80    | -73 | -73 |
| H* (After PenaltyTime) |      | 15     | 15  | 15  | -5     | -5  | 9   | -5     | 3   | 3   |
| R* (After PenaltyTime) |      | -41    | -41 | -41 | -60    | -60 | -47 | -60    | -53 | -53 |

\* this parameter is calculated internally in the UE and is only shown for clarification of the test procedure.

The UE is in the CELL\_FACH state, camping onto cell 1. SS configures Cell 2 and 3 with power levels given in column "T0" and starts to broadcast BCCH on the primary CCCH in cell 2 & 3. UE shall remain camped on the Cell 1 even after expiry of penalty time i.e. 40 seconds. SS sets downlink transmission power settings according to columns "T1" in table 8.3.1.21-1. The UE shall find cell 3 to be more suitable for service and hence perform a cell reselection to cell 3 after at least 40 Seconds (Penalty Time) after the power levels have been changed. After the completion of cell reselection, the UE shall transmit a CELL\_UPDATE message to the SS on the uplink CCCH of cell 3 and set IE "Cell update-cause" to "Cell Reselection". After the SS receives this message, it transmits a CELL\_UPDATE\_CONFIRM message, which includes the IE "RRC State Indicator" set to "CELL\_FACH", to the UE on the downlink DCCH. SS verifies that the UE does not send any response to this message. UE shall stay in CELL\_FACH state. SS then sets downlink transmission power settings according to columns "T2" in table 8.3.1.21-1. The UE shall find cell 2 to be more suitable for service and hence perform a cell reselection to cell 2 after at least 40 Seconds (Penalty Time) after the power levels have been changed. After the completion of cell reselection, the UE shall transmit a CELL\_UPDATE message to the SS on the uplink CCCH of cell 2 and set IE "Cell update-cause" to "Cell Reselection". After the SS receives this message, it transmits a CELL\_UPDATE\_CONFIRM message, which includes the IE "RRC State Indicator" set to "CELL\_FACH", to the UE on the downlink DCCH. SS verifies that the UE does not send any response to this message. UE shall stay in CELL\_FACH state.

## CELL UPDATE

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element                                      | Value/remark                                                                                             |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| U-RNTI<br>-SRNC Identity<br>-S-RNTI<br>Cell Update Cause | Check to see if set to '0000-0000-0001'<br>In step 4 and 8<br>Check to see if set to 'Cell Re-selection' |

### CELL UPDATE CONFIRM (Step 5 and 9)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| RRC State Indicator | CELL_FACH    |

### 8.3.1.23.5 Test requirement

After step 3 the UE shall reselect to cell 3 and then it shall transmit a CELL UPDATE message which, sets the value "cell reselection" in IE "Cell update cause".

After step 5 the UE shall not transmit any uplink message in response to the CELL UPDATE CONFIRMATION message received in step 4.

After step 7 the UE shall reselect to cell 2 and then it shall transmit a CELL UPDATE message which, sets the value "cell reselection" in IE "Cell update cause".

After step 9 the UE shall not transmit any uplink message in response to the CELL UPDATE CONFIRMATION message received in step 8.

### 8.3.1.24 Cell Update: HCS cell reselection in CELL\_PCH

#### 8.3.1.24.1 Definition

#### 8.3.1.24.2 Conformance requirement

This procedure is used to update UTRAN with the current cell of the UE after it has performed a cell reselection in CELL\_PCH state with HCS parameters applied.

#### Reference

3GPP TS 25.331 clause 8.3.1.

3GPP TS 25.304 clause 5.2.6.1.4.

3GPP TS 25.304 clause 5.4.3.

#### 8.3.1.24.3 Test purpose

To confirm that the UE can read HCS related SIB information and act upon all HCS parameters. To confirm that the UE executes a cell update procedure after the successful reselection of another UTRA cell. To confirm that the UE sends the correct uplink response message when executing cell update procedure due to cell reselection.

#### 8.3.1.24.4 Method of test

#### Initial Condition

System Simulator: 3 cells—Cell 1 is active with downlink transmission power shown in Column To in table 8.3.1.21-1. Cell 2 and 3 are switched off.

UE: CELL\_PCH (state 6-12) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain(s) supported by the UE.

### Specific Message Content

For system information blocks 3, 4, 11 & 12 for Cell 1 (gives IE's which are different from defaults given in 34.108 sec 6.1) to be transmitted before idle update preamble.

## Test Procedure

Table 8.3.1.21-1

| Parameter               | Unit | Cell 1 |     |     | Cell 2 |     |     | Cell 3 |     |     |
|-------------------------|------|--------|-----|-----|--------|-----|-----|--------|-----|-----|
|                         |      | T0     | T1  | T2  | T0     | T1  | T2  | T0     | T1  | T2  |
| UTRA RF Channel Number  |      | Ch. 1  |     |     | Ch. 1  |     |     | Ch. 1  |     |     |
| CPICH RSCP              | dBm  | -61    | -61 | -61 | -80    | -80 | -67 | -80    | -73 | -73 |
| H* (After Penalty Time) |      | 15     | 15  | 15  | -5     | -5  | 9   | -5     | 3   | 3   |
| R* (After Penalty Time) |      | -41    | -41 | -41 | -60    | -60 | -47 | -60    | -53 | -53 |

\* this parameter is calculated internally in the UE and is only shown for clarification of the test procedure.

The UE is in the CELL\_PCH state, camping onto cell 1. SS configures Cell 2 and 3 with power levels given in column "T0" and starts to broadcast BCCH on the primary CCCH in cell 2 & 3. UE shall remain camped on the Cell 1 even after expiry of penalty time i.e. 40 seconds. SS sets downlink transmission power settings according to columns "T1" in table 8.3.1.22-1. The UE shall find cell 3 to be more suitable for service and hence perform a cell reselection to cell 3 after at least 40 Seconds (Penalty Time) after the power levels have been changed. After the completion of cell reselection, the UE shall move to CELL\_FACH state and transmit a CELL\_UPDATE message to the SS on the uplink CCCH of cell 3 and set IE "Cell update cause" to "Cell Reselection". After SS receives this message, it transmits a CELL\_UPDATE\_CONFIRM message, which includes the IE "RRC State Indicator" set to "CELL\_PCH", to the UE on the downlink DCCH. UE shall return to CELL\_PCH state in Cell 3 and will not transmit anything on PRACH. SS then sets downlink transmission power settings according to columns "T2" in table 8.3.1.22-1. The UE shall find cell 2 to be more suitable for service and hence perform a cell reselection to cell 2 after at least 40 Seconds (Penalty Time) after the power levels have been changed. After the completion of cell reselection, the UE shall move to CELL\_FACH state and transmit a CELL\_UPDATE message to the SS on the uplink CCCH of cell 2 and set IE "Cell update cause" to "Cell Reselection". After the SS receives this message, it transmits a CELL\_UPDATE\_CONFIRM message, which includes the IE "RRC State Indicator" set to "CELL\_PCH", to the UE on the downlink DCCH. UE shall return to CELL\_PCH state in Cell 2 and will not transmit anything on PRACH.

## Expected sequence

| Step | Direction |    | Message             | Comment                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|-----------|----|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                     |                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1    |           |    |                     | The UE is in the CELL_PCH state in cell 1                                                                                                                                                                                                                                                                                                                                                                       |
| 2    |           | ←  | BCCH                | SS applies the downlink transmission power settings, according to the values in columns "T0" of table 8.3.1.1-1. The SS starts to broadcast BCCH on the primary CCPCCH in cell 2 and Cell 3. The UE shall find still find Cell 1 best for service even after penalty time of 40 seconds, and shall remain in Cell 1 in CELL_PCH State                                                                           |
| 3    |           |    |                     | SS changes the power levels as per column 'T1' in the table 8.3.1.21-1. For the time equal to Penalty time 40 Seconds, after the change in power levels, the UE shall still find Cell 1 as best for service and remain in cell 1. After Penalty time of 40 Seconds, UE shall find Cell 3 better for service and perform a reselection. SS waits for the maximum duration required for the UE to camp to cell 3. |
| 4    |           | →  | CELL UPDATE         | The UE moves to CELL_FACH state and transmits this message with the IE "Cell update cause" set to "cell reselection". Received in Cell 3                                                                                                                                                                                                                                                                        |
| 5    |           | ←  | CELL UPDATE CONFIRM | IE "RRC State Indicator" is set to "CELL_PCH".                                                                                                                                                                                                                                                                                                                                                                  |
| 7    |           |    |                     | SS changes the power levels as per column 'T2' in the table 8.3.1.21-1. For the time equal to Penalty time 40 Seconds, after the change in power levels, the UE shall still find Cell 3 as best for service and remain in cell 3. After Penalty time of 40 Seconds, UE shall find Cell 2 better for service and perform a reselection. SS waits for the maximum duration required for the UE to camp to cell 2. |
| 8    |           | →  | CELL UPDATE         | The UE moves to CELL_FACH state and transmits this message with the IE "Cell update cause" set to "cell reselection". Received in Cell 2                                                                                                                                                                                                                                                                        |
| 9    |           | ←  | CELL UPDATE CONFIRM | IE "RRC State Indicator" is set to "CELL_PCH".                                                                                                                                                                                                                                                                                                                                                                  |

| → Qrxlevmin                                      | -115 dBm                                                                    |

## CELL UPDATE

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element                                      | Value/remark                                                                                             |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| U-RNTI<br>-SRNC Identity<br>-S-RNTI<br>Cell Update Cause | Check to see if set to '0000-0000-0001'<br>In step 4 and 7<br>Check to see if set to 'Cell Re-selection' |

### CELL UPDATE CONFIRM (Step 5 and 8)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| RRC State Indicator | CELL_PCH     |

#### 8.3.1.24.5 Test requirement

After step 3 the UE shall reselect to cell 3 and then it shall transmit a CELL UPDATE message which, sets the value "cell reselection" in IE "Cell update cause".

After step 6 the UE shall reselect to cell 2 and then it shall transmit a CELL UPDATE message which, sets the value "cell reselection" in IE "Cell update cause".

## 8.3.2 URA Update

### 8.3.2.1 URA Update: Change of URA

#### 8.3.2.1.1 Definition

#### 8.3.2.1.2 Conformance requirement

This procedure is to update UTRAN with the current URA of the UE after a change of URA has occurred in URA\_PCH state. It may also be used for supervision of the RRC connection, even if no change of URA takes place.

#### Reference

3GPP TS 25.331 clause 8.3.1

#### 8.3.2.1.3 Test purpose

To confirm that the UE executes an URA update procedure after the successful change of URA. To confirm UE responds correctly when it re-selects to a new cell while waiting for URA UPDATE CONFIRM message from SS.

#### 8.3.2.1.4 Method of test

#### Initial Condition

System Simulator: 3 cells – Cell 1 and 2 are active with URA-ID 1 and the downlink transmission power shown in column marked "T0" in table 8.3.2.1, while cell 3 is active with URA-ID 2.

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108, with URA-ID 1 from the list of URA-ID in cell 1.

Test Procedure

Table 8.3.2.1

| Parameter              | Unit        | Cell 1 |     |     | Cell 2 |     |     | Cell 3 |     |     |
|------------------------|-------------|--------|-----|-----|--------|-----|-----|--------|-----|-----|
|                        |             | T0     | T1  | T2  | T0     | T1  | T2  | T0     | T1  | T2  |
| UTRA RF Channel Number |             | Ch. 1  |     |     | Ch. 1  |     |     | Ch. 1  |     |     |
| CPICH Ec               | dBm/3.84MHz | -60    | -75 | -75 | -75    | -60 | -75 | -75    | -75 | -60 |

The test begins with the downlink power transmission of all cells set according to 'T0' column in table 8.3.2.1. The UE is in the URA\_PCH state and assigned with only 1 URA identity in cell 1: URA-ID 1. The SS then adjusts the transmission power again according to 'T1' column. This is expected to cause the UE to perform a cell reselection to cell 2. Since same URA identity is broadcasted in cell 1 and 2, the UE shall not perform any URA update procedure due to the change of URA. Next SS adjusts the transmission power according to 'T2' column. UE shall perform a cell reselection to cell 3 and when the UE finds that its current URA-ID 1 is not in the new broadcasted list of URA-IDs, it moves to CELL\_FACH state and transmits a URA UPDATE message on the uplink CCCH. After the SS receives this message, it transmits a URA UPDATE CONFIRM message, which includes the IEs "RRC State Indicator" and IE "URA-ID" to the UE on the downlink DCCH. The IE "RRC State Indicator" is set to "URA\_PCH". UE returns to URA\_PCH state in cell 3 without sending any uplink response message. Next SS adjusts the transmission power according to 'T1' column. UE shall re-select to cell 2 and transmit a URA UPDATE message to SS. However, SS do not acknowledge but adjusts the transmission power according to 'T0' column. UE shall perform cell re-selection to cell 1 and then sent a URA UPDATE message to SS. Finally SS shall transmit URA UPDATE CONFIRM message to UE.

## Expected sequence

| Step | Direction |    | Message            | Comment                                                                                                                                                                                                                                  |
|------|-----------|----|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                    |                                                                                                                                                                                                                                          |
| 1    |           |    |                    | The UE is updated with only 1 URA identity carried currently by cell 1. The starting state of the UE is URA_PCH                                                                                                                          |
| 2    |           |    |                    | SS set the power transmission of all cells according to column 'T1' of table 8.3.2.1.                                                                                                                                                    |
| 3    |           |    |                    | UE shall perform a cell reselection but shall not transmit URA UPDATE message with the update cause of "change of URA".                                                                                                                  |
| 4    |           |    |                    | SS set the power transmission of all cells according to column 'T2' of table 8.3.2.1.                                                                                                                                                    |
| 5    |           | →  | URA UPDATE         | The UE shall perform a cell reselection first and when it finds that its current URA-ID-1 is not in the newly broadcasted list of URA-IDs, it shall then transmit this message and set value "change of URA" into IE "URA update cause". |
| 6    |           | ←  | URA UPDATE CONFIRM | Message comprises IE "RRC State Indicator" set "URA_PCH", and also IE "URA Identity" equals to "URA-ID-2".                                                                                                                               |
| 7    |           |    |                    | SS set the power transmission of all cells according to column 'T1' of table 8.3.2.1.                                                                                                                                                    |
| 8    |           | →  | URA UPDATE         |                                                                                                                                                                                                                                          |
| 9    |           |    |                    | SS do not respond to the URA UPDATE message from UE and set the power transmission of all cells according to column 'T0' of table 8.3.2.1.                                                                                               |
| 10   |           | →  | URA UPDATE         |                                                                                                                                                                                                                                          |
| 11   |           | ←  | URA UPDATE CONFIRM |                                                                                                                                                                                                                                          |

## Specific Message Contents

## URA UPDATE (Step 5, 8 and 10)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| - SRNC Identity     | Check to see if set to '0000 0000 0001'           |
| - S-RNTI            | Check to see if set to '0000 0000 0000 0000 0001' |
| URA Update Cause    | Check to see if set to 'change of URA'            |

## URA UPDATE CONFIRM (Step 6)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| URA identity        | URA-ID 2     |

### URA UPDATE CONFIRM (Step 11)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| URA identity        | URA-ID 1     |

#### 8.3.2.1.5 Test requirement

After step 2 the UE shall not transmit a URA UPDATE message.

After step 4 the UE shall find that URA-ID 2 is not in its maintained list of URA-IDs. After cell reselection, the UE shall move to CELL\_FACH state and transmit a URA UPDATE message setting value "change of URA" into IE "URA update cause".

After step 7 the UE shall find that URA-ID 1 is not in its maintained list of URA-IDs. After cell reselection, the UE shall move to CELL\_FACH state and transmit a URA UPDATE message setting value "change of URA" into IE "URA update cause".

After step 9 the UE shall find the new cell and transmit a URA UPDATE message setting value "change of URA" into IE "URA update cause".

### 8.3.2.2 URA Update: Periodical URA update and Reception of Invalid message

#### 8.3.2.2.1 Definition

#### 8.3.2.2.2 Conformance requirement

This procedure is to update UTRAN with the current URA of the UE when the UE detects that it is still within the service area after the expiry of periodic URA updating timer T305.

#### Reference

3GPP TS 25.331 clause 8.3.1

#### 8.3.2.2.3 Test purpose

To confirm that the UE executes a URA update procedure after the expiry of timer T305. To verify that the UE handles an invalid URA UPDATE CONFIRM message correctly when executing the URA update procedure.

#### 8.3.2.2.4 Method of test

#### Initial Condition

System Simulator: 1 cell

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108.

#### Test Procedure

The UE is in URA\_PCH state. When the UE detects the expiry of timer T305, set according to the value specified in system information, the UE moves to CELL\_FACH state and transmits a URA UPDATE message to the SS on the uplink CCCH. The message shall indicate the cause to be "periodic URA update" in IE "URA update cause". SS replies with an invalid URA UPDATE CONFIRM message sent on downlink CCCH, and check to see if the UE handles this event properly. The UE shall attempt to retransmit the identical URA UPDATE message. After the SS receives the

second URA UPDATE message, it transmits a correct URA UPDATE CONFIRM message, which includes the IE "new U-RNTI", to the UE on the downlink DCCH. Then the UE shall then transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH. The UE returns to CELL\_FACH state.

#### Expected sequence

| Step | Direction |    | Message                            | Comment                                                                                        |
|------|-----------|----|------------------------------------|------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                    |                                                                                                |
| 1    |           |    |                                    | The UE is in URA_PCH state. SS wait until T305 timer has expired.                              |
| 2    |           | →  | URA UPDATE                         | UE shall transmit this message and set value "periodic URA update" into IE "URA update cause". |
| 3    |           | ←  | URA UPDATE CONFIRM                 | See specific message content.                                                                  |
| 4    |           | →  | URA UPDATE                         | UE shall not return to idle mode immediately, but attempts to re-transmit this message.        |
| 5    |           | ←  | URA UPDATE CONFIRM                 | Including IE "new U-RNTI"                                                                      |
| 6    |           | →  | UTRAN MOBILITY INFORMATION CONFIRM |                                                                                                |

#### Specific Message Contents

##### URA UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| —SRNC Identity      | Check to see if set to '0000-0000-0001'           |

| URA Update Cause    | Check to see if set to 'Periodic URA update'      |

##### URA UPDATE (Step 4)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element        | Value/remark                                                                    |
|----------------------------|---------------------------------------------------------------------------------|
| U-RNTI                     |                                                                                 |
| —SRNC Identity             | Check to see if set to '0000-0000-0001'                                         |
| —S-RNTI                    | Check to see if set to '0000-0000-0000-0000-0001'                               |
| RRC Transaction identifier | Check to see if set to the value given in URA UPDATE CONFIRM message in step 3. |
| URA Update Cause           | Check to see if set to 'Periodic URA update'                                    |
| Protocol error indicator   | TRUE                                                                            |
| Protocol error information |                                                                                 |
| — Protocol error cause     | ASN.1 violation or encoding error                                               |

##### URA UPDATE CONFIRM (Step 3)

| Information Element | Value/remark |
|---------------------|--------------|
| All IEs             | Not Present  |

### URA UPDATE CONFIRM (Step 5)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark               |
|---------------------|----------------------------|
| New U-RNTI          |                            |
| SRNC Identity       | '0000 0000 0001'           |
| S-RNTI              | '0000 0000 0000 0000 1111' |

### UTRAN MOBILITY INFORMATION CONFIRM (Step 6)

Only the message type IE of this message is checked.

#### 8.3.2.2.5 Test requirement

After step 1 the UE shall detect the expiry of timer T305, move to CELL\_FACH state, and transmit a URA UPDATE message which sets the value "periodical cell update" into IE "URA update-cause".

After step 3 the UE shall re-transmit URA UPDATE message with IE "Protocol error indicator" set to 'TRUE' and IE "Protocol error information" set to "ASN.1 violation and encoding error".

After step 5 the UE shall transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH and returns to the CELL\_FACH state.

### 8.3.2.3 URA Update: re-entering of service area after T305 expiry

#### 8.3.2.3.1 Definition

#### 8.3.2.3.2 Conformance requirement

This procedure is to update UTRAN with the current URA of the UE if the UE detects that it is out of service area after the expiry of timer T305, and then subsequently re-enters the service area before the expiry of T307.

#### Reference

3GPP TS 25.331 clause 8.3.1

#### 8.3.2.3.3 Test purpose

To confirm that the UE executes a URA update procedure when the UE re-enters the service area before the expiry of timer T307, after being out of service area at the expiry of timer T305.

#### 8.3.2.3.4 Method of test

#### Initial Condition

System Simulator: 1 cell with URA-ID 1 and the downlink transmission power shown in column marked "T0" in table 8.3.2.3.

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108, with URA-ID 1 in the list of URA-ID.

## Test Procedure

Table 8.3.2.3

| Parameter              | Unit        | Cell 1 |     |
|------------------------|-------------|--------|-----|
|                        |             | T0     | T1  |
| UTRA RF Channel Number |             | Ch. 1  |     |
| CPICH Ec               | dBm/3.84MHz | -60    | -80 |

Table 8.3.2.3 illustrates the downlink power to be applied at various time instants of the test execution. Columns marked "T0" denote the initial conditions.

The UE is initially in URA\_PCH state. The content of the SYSTEM INFORMATION BLOCK TYPE 3 and 4 is modified. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.2.3 so that  $S < 0$ . When the UE detects the expiry of timer T305 according to the system information, the UE finds that it is out of service area. The UE is expected to search for cell to camp. Then SS configures its downlink transmission power settings according to columns "T0" in table 8.3.2.3 so that  $S > 0$ . The UE shall detect that it returns to normal service before T307 expires. The UE shall move to CELL\_FACH state and starts transmitting a URA UPDATE message which contains the value "re-entered service area" in IE "URA update cause" to the SS on the uplink CCCH. After the SS receives this message, it transmits a URA UPDATE CONFIRM message which includes the IE "new C-RNTI", and "new U-RNTI" to the UE on the downlink DCCH. Then the UE shall transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.

## Expected sequence

| Step | Direction |    | Message                                                              | Comment                                                                                                                                                                            |
|------|-----------|----|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                                                      |                                                                                                                                                                                    |
| 1    |           |    |                                                                      | The UE starts operating from URA_PCH state.                                                                                                                                        |
| 1a   |           | ←  | MASTER INFORMATION BLOCK<br>SYSTEM INFORMATION BLOCK TYPE 3<br>and 4 | SS changes the contents of MASTER INFORMATION BLOCK and SYSTEM INFORMATION BLOCK (see specific message contents).                                                                  |
| 1b   |           | ←  | PAGING TYPE 1                                                        | Include IE "BCCH modification info"                                                                                                                                                |
| 2    |           |    |                                                                      | SS configures its downlink transmission power settings according to columns "T1" in table 8.3.2.3 such that the cell 1 is no longer suitable for camping i.e. $S < 0$ .            |
| 3    |           |    |                                                                      | The UE shall attempt to perform a URA update upon the expiry of timer T305. It shall discover that it is out of service and starts searching for cell to camp. (T307 timer starts) |
| 4    |           |    |                                                                      | SS configures its downlink transmission power settings according to columns "T0" in table 8.3.2.3 before T307 expires.                                                             |
| 5    |           | →  | URA UPDATE                                                           | Value "re-entered service area" shall be set in IE "URA update cause"                                                                                                              |
| 6    |           | ←  | URA UPDATE CONFIRM                                                   | The message includes IEs "new C-RNTI", and "new U-RNTI"                                                                                                                            |
| 7    |           | →  | UTRAN MOBILITY INFORMATION CONFIRM                                   |                                                                                                                                                                                    |

## Specific Message Contents

### MASTER INFORMATION BLOCK (Step 1a)

Use the same message sub-type found in clause 6.1 of TS 34.108, with the following exception.

| Information Element | Value/remark |
|---------------------|--------------|
| MIB-Tag             | 2            |

### SYSTEM INFORMATION BLOCK TYPE 3 and 4 (Step 1a)

Use the same message sub-type found in clause 6.1 of TS 34.108, with the following exception.

| Information Element | Value/remark |
|---------------------|--------------|
| Qrxlevmin           | -70          |

### PAGING TYPE 1 (Step 1b)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element      | Value/remark |
|--------------------------|--------------|
| Paging record list       | Not Present  |
| BCCH modification info   |              |
| — MIB-Value tag          | 2            |
| — BCCH modification time | Not present  |

### URA UPDATE (Step 5)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| — SRNC-Identity     | Check to see if set to '0000-0000-0001'           |
| — S-RNTI            | Check to see if set to '0000-0000-0000-0000-0001' |
| URA-Update-Cause    | Check to see if set to 're-entered service area'  |

### URA UPDATE CONFIRM (Step 6)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element | Value/remark                                                                                    |
|---------------------|-------------------------------------------------------------------------------------------------|
| New U-RNTI          |                                                                                                 |
| — SRNC-Identity     | '0000-0000-0001'                                                                                |
| — S-RNTI            | '0000-0000-0000-1111-1111'                                                                      |
| New C-RNTI          | Arbitrary 16-bit string which is different the assigned C-RNTI in RRC CONNECTION SETUP message. |

### 8.3.2.3.5 ——— Test requirement

After step 2 the UE shall detect that it is out of service area and shall not send a URA UPDATE on the uplink CCCH channel.

After step 4 the UE shall transmit a URA UPDATE message which sets value "re-entered service area" into IE "URA update-cause".

After step 6 the UE shall transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.

**8.3.2.4 URA Update: loss of service after expiry of timers T307 and T305**

**8.3.2.4.1 Definition**

**8.3.2.4.2 Conformance requirement**

This procedure is required to handle the case when the UE fails to update UTRAN with the current URA of after expiry of timers T307 and T305 consecutively. The UE shall move to idle mode subsequently.

**Reference**

3GPP TS 25.331 clause 8.3.1

**8.3.2.4.3 Test purpose**

To confirm that the UE moves to idle mode after the expiry of timer T307, following an expiry of timer T305 when it discovers that it is out of service area.

**8.3.2.4.4 Method of test**

**Initial Condition**

System Simulator: 1 cell

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108.

**Test Procedure**

**Table 8.3.2.4**

| Parameter              | Unit        | Cell 1 |     |
|------------------------|-------------|--------|-----|
|                        |             | T0     | T1  |
| UTRA RF Channel Number |             | Ch. 1  |     |
| CPICH Ec               | dBm/3.84MHz | -60    | -80 |

Table 8.3.2.4 illustrates the downlink power to be applied at various time instants of the test execution. Columns marked "T0" denote the initial conditions.

The UE is in URA\_PCH state. The content of the SYSTEM INFORMATION BLOCK TYPE 3 and 4 is modified. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.2.3 so that  $S < 0$ . When the UE detects the expiry of periodic URA updating timer T305 according to the system information, the UE detects that it is out of service area. After the expiry of timer T307, the UE moves to the idle state. SS configures its downlink transmission power settings according to columns "T0" in table 8.3.2.3 so that  $S > 0$ . SS verifies that UE is in idle mode state by sending a PAGING TYPE 1 message to the UE using UE identity. UE shall respond to this message.

## Expected sequence

| Step | Direction |    | Message                                                              | Comment                                                                                                                                                                          |

| Qrxlevmin           | -70          |

## PAGING TYPE 1 (Step 1b)

Use the same message sub-type found in Annex A, with the following exceptions:

| Information Element      | Value/remark |
|--------------------------|--------------|
| Paging record list       | Not Present  |
| BCCH modification info   |              |
| – MIB Value tag          | 2            |
| – BCCH modification time | Not present  |

## 8.3.2.4.5 ————— Test requirement

After step 2 the UE shall not transmit any URA UPDATE message on the uplink CCCH.

After step 5, UE shall enter idle mode state.

### ~~8.3.2.5 URA Update: Success after Confirmation error of URA-ID list~~

#### ~~8.3.2.5.1 Definition~~

#### ~~8.3.2.5.2 Conformance requirement~~

~~UE transmits a URA UPDATE message to the UTRAN when it needs to update UTRAN with the current URA of the UE. UTRAN shall respond to the URA UPDATE message by sending a URA UPDATE CONFIRM message. When the indicated URA-ID in the received URA UPDATE CONFIRM message is not found in the list of URA-IDs that is broadcasted in system information block type 2, the UE transmits a URA UPDATE message repeatedly until its internal counter V302 is greater than N302.~~

#### ~~Reference~~

~~3GPP TS 25.331 clause 8.3.1~~

#### ~~8.3.2.5.3 Test purpose~~

~~To confirm that the UE retries to perform the URA update procedure following a confirmation error of URA-ID list.~~

#### ~~8.3.2.5.4 Method of test~~

#### ~~Initial Condition~~

~~System Simulator: 1 cell~~

~~UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108.~~

#### ~~Test Procedure~~

~~At the start of this test, the UE is brought to URA\_PCH state and assigned a URA with URA-ID 1. When the UE detects the expiry of timer T305 according to the system information, the UE moves to CELL\_FACH state and transmits a URA UPDATE message to the SS on the uplink CCCH. The reason for performing URA updating shall be set to "periodic URA update" in IE "URA update cause". After the SS receives this message, it transmits a URA UPDATE CONFIRM message which includes the IE "RRC state indicator" set to "URA\_PCH" and IE "URA identity" set to "URA-ID 2" to the UE on the downlink DCCH. The UE finds that the indicated URA-ID is not included in the list of URA-IDs broadcasted in system information block type 2, and then the UE shall retry to transmit a URA UPDATE message for a confirmation error of URA-ID list. SS continue to send the same URA UPDATE CONFIRM message until N302+1 URA UPDATE messages have been received. Then SS transmits a URA UPDATE CONFIRM message to the UE which includes IE "URA Identity" set to "URA-ID 1" and IE "new U-RNTI". The UE shall find this URA-ID in its URA-ID list and transmits an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.~~

## Expected sequence

| Step | Direction |    | Message                            | Comment                                                                                                                                  |
|------|-----------|----|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

| 4    |           | ←  | URA UPDATE CONFIRM                 | SS transmits this message, setting the value "URA-ID 2" to IE "URA Identity".<br>SS waits for T302 to expire and then returns to step 2. |
| 5    |           | ←  | URA UPDATE CONFIRM                 | SS transmits this message, setting IE "URA Identity" to "URA-ID 1". This message also comprises IE "New U-RNTI".                         |
| 6    |           | →  | UTRAN MOBILITY INFORMATION CONFIRM |                                                                                                                                          |

## Specific Message Contents

## URA UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| —SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| —S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| URA Update Cause    | Check to see if set to 'Periodic URA update'      |

## URA UPDATE CONFIRM (Step 4)

Use the same message sub-type as specified in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| URA Identity        | 2            |

## URA UPDATE CONFIRM (Step 5)

Use the same message sub-type as specified in Annex A, with the following exceptions:

| Information Element | Value/remark               |
|---------------------|----------------------------|
| New U-RNTI          |                            |
| —SRNC Identity      | '0000-0000-0001'           |
| —S-RNTI             | '0000-0000-0000-0101-0101' |
| URA Identity        | 1                          |

## UTRAN MOBILITY INFORMATION CONFIRM (Step 6)

Only the message type IE in this message is checked.

### 8.3.2.5.5 Test requirement

After step 1 the UE shall detect the expiry of timer T305, move to CELL\_FACH state, transmit a URA UPDATE message on the uplink CCCH and set value "periodic URA update" into IE "URA update cause".

After step 4 the UE shall re-transmit a URA UPDATE message after it detects a confirmation error of URA-ID list for the URA-ID indicated in the URA UPDATE CONFIRM message. A total of (N302+1) URA UPDATE messages shall be received by the SS.

After step 5 the UE shall transmit an UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.

### 8.3.2.6 URA Update: Failure (V302 is greater than N302: Confirmation error of URA-ID list)

#### 8.3.2.6.1 Definition

#### 8.3.2.6.2 Conformance requirement

UE transmits a URA UPDATE message to the UTRAN when it needs to update UTRAN with the current URA of the UE. When the indicated URA-ID in the received URA UPDATE CONFIRM message is not in the list of URA-IDs that is broadcasted in system information block type 2, the UE transmits URA UPDATE messages repeatedly until its internal counter V302 is greater than N302. If V302 is greater than N302 then the UE enters idle state.

#### Reference

3GPP TS 25.331 clause 8.3.1

#### 8.3.2.6.3 Test purpose

To confirm that the UE make repeated attempts to perform the URA update procedure following a detection of a confirmation error of URA-ID list. It then moves to idle state when internal counter V302 is greater than N302.

#### 8.3.2.6.4 Method of test

#### Initial Condition

System Simulator: 1 cell

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108.

#### Test Procedure

The UE is originally in URA\_PCH state updated with URA-ID 1. When the UE detects the expiry of timer T305 according to the system information, the UE shall move to CELL\_FACH state and transmit a URA UPDATE message to the SS on the uplink CCCH. In this message, the value "periodic URA update" shall be set in IE "URA update cause". After the SS receives this message, it transmits a URA UPDATE CONFIRM message which includes the IE "RRC state indicator" set to "URA\_PCH" and indicating the IE "URA Identity" to be "URA-ID 2" to the UE on the downlink DCCH. The UE finds that the indicated URA-ID is not included in the list of URA-IDs broadcasted. Then the UE shall retry to transmit a URA UPDATE message for N302 times and each time the SS responds with the URA UPDATE CONFIRM message similar to the previous one. After that, the UE shall enter idle state.

Expected sequence

| Step | Direction |    | Message            | Comment                                                                                                                                                                     |
|------|-----------|----|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                    |                                                                                                                                                                             |
| 1    |           |    |                    | The UE is in URA_PCH state at the start of the test. SS sets internal counter K to 0.                                                                                       |
| 2    |           | →  | URA UPDATE         | The message shall indicate "periodic URA update" in IE "URA update-cause". This message is sent following the expiry of timer T305. SS increments counter K by 1.           |
| 3    |           | ←  | URA UPDATE CONFIRM | The SS transmit this message and set IE "URA Identity" to "URA-ID 2". When K is greater than N302 proceeds to step 4, else SS waits for T302 to expire and executes step 2. |
| 4    |           |    | Void               | The UE shall enter idle state.                                                                                                                                              |

Specific Message Contents

URA UPDATE CONFIRM (Step 3)

Use the same message sub-type defined in Annex A, with the following exceptions:

| Information Element | Value/remark |
|---------------------|--------------|
| URA Identity        | 2            |

8.3.2.6.5 ——— Test requirement

After step 1 the UE shall detect the expiry of timer T305, then it shall move to CELL\_FACH state and transmit a URA UPDATE message on the uplink CCCH, setting value "periodic URA update" in IE "URA update-cause".

After step 3 and if K is not greater than N302, the UE shall retry to transmit a URA UPDATE message after it detects the confirmation error of URA-ID list for the URA-ID included in the URA UPDATE CONFIRM message.

After step 3 and if K is greater than N302, the UE shall stop transmitting URA UPDATE message and then enters idle state.

8.3.2.7 ——— URA Update: Success after T302 timeout

8.3.2.7.1 ——— Definition

8.3.2.7.2 ——— Conformance requirement

The UE transmits an URA UPDATE message to the UTRAN when it needs to update UTRAN with the current URA identity stored the UE. When the UE fails to receive any URA UPDATE CONFIRM message after T302 timer expires, it transmits a URA UPDATE message repeatedly at an interval of T302 timer value until its internal counter V302 is greater than N302.

Reference

3GPP TS 25.331 clause 8.3.1

8.3.2.7.3 ——— Test purpose

To confirm that the UE attempts to repeat the URA update procedure upon the expiry of timer T302.

~~8.3.2.7.4 Method of test~~

~~Initial Condition~~

~~System Simulator: 1 cell~~

~~UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108.~~

~~Test Procedure~~

~~The UE is in URA\_PCH. When the UE detects the expiry of timer T305 according to the system information, the UE moves to CELL\_FACH state and transmits a URA UPDATE message to the SS on the uplink CCCH, setting value "periodic URA update" into IE "URA update cause". The SS ignores this message. The UE shall then retry to transmit a URA UPDATE message after the expiry of timer T302. SS transmits a URA UPDATE CONFIRM message to the UE to end the procedure.~~

~~Expected sequence~~

~~Use the same message sub-type as in Annex A.~~

~~8.3.2.7.5 Test requirement~~

~~After step 1 the UE shall detect the expiry of timer T305, then it shall move to CELL\_FACH state and transmit a URA UPDATE message on the uplink CCCH. The updating cause shall be set to "periodic URA update" in IE "URA update cause".~~

~~After step 3 the UE shall retry to transmit a URA UPDATE message at the expiry of timer T302.~~

~~8.3.2.8 Void~~

~~8.3.2.9 URA Update: Failure (UTRAN initiate an RRC connection release procedure on CCCH)~~

~~8.3.2.9.1 Definition~~

~~8.3.2.9.2 Conformance requirement~~

~~The UE transmits a URA UPDATE message to the UTRAN when it needs to update UTRAN with information on the current URA of the UE. If the UE receives a RRC CONNECTION RELEASE message on downlink CCCH, it shall enter idle state.~~

## Reference

3GPP TS 25.331 clause 8.3.1

## 8.3.2.9.3 Test purpose

To confirm that the UE moves to idle state upon the reception of RRC CONNECTION RELEASE message on downlink CCCH during a URA update procedure.

## 8.3.2.9.4 Method of test

## Initial Condition

System Simulator: 1 cell

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108.

## Test Procedure

The UE is in URA\_PCH state. When the UE detects the expiry of periodic URA updating timer T305, the UE moves to CELL\_FACH state and transmits a URA UPDATE message to the SS on the uplink CCCH. The message shall indicate the cause to be "periodic URA update" in IE "URA update cause". The SS transmits RRC CONNECTION RELEASE message on downlink CCCH. The UE shall return to idle mode after release of all current signalling flows and radio access bearers.

## Expected sequence

| Step | Direction |    | Message                | Comment                                                                                        |
|------|-----------|----|------------------------|------------------------------------------------------------------------------------------------|
|      | UE        | SS |                        |                                                                                                |
| 1    |           |    |                        | The UE is in the URA_PCH state. SS wait until T305 timer has expired.                          |
| 2    |           | →  | URA UPDATE             | UE shall transmit this message and set value "periodic URA update" into IE "URA update cause". |
| 3    |           | ←  | RRC CONNECTION RELEASE | SS transmits RRC CONNECTION RELEASE message to the UE on the downlink CCCH.                    |
| 4    |           |    |                        | The UE releases L2 signalling radio bearer and radio resources then the UE goes to idle mode.  |

## Specific Message Contents

## URA UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| - SRNC Identity     | Check to see if set to '0000-0000-0001'           |
| - S-RNTI            | Check to see if set to '0000-0000-0000-0000-0001' |
| URA Update Cause    | Check to see if set to 'Periodic URA update'      |

## RRC CONNECTION RELEASE (Step 3)

Use the same message sub-type found in Annex A

### 8.3.2.9.5 ——— Test requirement

After step 1 the UE shall transmit a URA UPDATE message on the uplink CCCH and set value "periodic URA update" into IE "Cell update cause".

After step 3 the UE shall enter idle state.

### 8.3.2.10 ——— URA Update: Reception of URA UPDATE CONFIRM message that causes invalid configuration

#### 8.3.2.10.1 ——— Definition

#### 8.3.2.10.2 ——— Conformance Requirement

If the UE encounters a URA UPDATE CONFIRM message that set the variable INVALID\_CONFIGURATION to TRUE while executing a URA update procedure, it shall check the current value of its internal counter V302. If V302 is not greater than N302, the UE shall re-transmits URA UPDATE message on uplink CCCH, restart T302 timer and increments V302. On the other hand, if V302 is greater than N302, the UE shall abandon cell update procedure and enters idle mode.

#### 8.3.2.10.3 ——— Test Purpose

To confirm that the UE retransmits a URA UPDATE message when it receives a URA UPDATE CONFIRM message that will trigger an invalid configuration in the UE, if the number of retransmissions has not reached the maximum allowed value.

#### 8.3.2.10.4 ——— Method of Test

##### Initial Condition

System Simulator: 1 cell

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108.

##### Test Procedure

The UE is in URA\_PCH state. When the UE detects the expiry of timer T305 according to the system information, the UE moves to CELL\_FACH state and transmits a URA UPDATE message to the SS on the uplink CCCH. This message shall contain value "periodical URA update" in IE "URA update cause". Upon receiving such a message, the SS replies with a URA UPDATE CONFIRM message with IE "RRC State Indicator" set to "CELL\_DCH". The UE shall detect its variable "invalid configuration" is set and re-transmit URA UPDATE message. SS then transmit a valid URA UPDATE CONFIRM UPDATE message to end the procedure.

## Expected Sequence

| Step | Direction |    | Message            | Comment                                                                                                                                  |
|------|-----------|----|--------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                    |                                                                                                                                          |
| 1    |           |    |                    | The UE is in the URA_PCH state. SS wait until T305 timer has expired.                                                                    |
| 2    |           | →  | URA UPDATE         | UE shall transmit this message and set value "periodic URA update" into IE "URA update cause".                                           |
| 3    |           | ←  | URA UPDATE CONFIRM |                                                                                                                                          |
| 4    |           | →  | URA UPDATE         | IE "Protocol error indicator" is set to TRUE and IE "Protocol error information" is set to "Information element value not comprehended". |
| 5    |           |    | Void               |                                                                                                                                          |
| 6    |           |    | Void               |                                                                                                                                          |
| 7    |           | ←  | URA UPDATE CONFIRM |                                                                                                                                          |

## URA UPDATE (Step 2)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| - SRNC Identity     | Check to see if set to '0000-0000-0001'           |
| - S-RNTI            | Check to see if set to '0000-0000-0000-0000-0001' |
| URA Update Cause    | Check to see if set to 'Periodic URA update'      |

## URA UPDATE (Step 4)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element        | Value/remark                                      |
|----------------------------|---------------------------------------------------|
| U-RNTI                     |                                                   |
| - SRNC Identity            | Check to see if set to '0000-0000-0001'           |
| - S-RNTI                   | Check to see if set to '0000-0000-0000-0000-0001' |
| URA Update Cause           | Check to see if set to 'Periodic URA update'      |
| Protocol error indicator   | TRUE                                              |
| Protocol error information |                                                   |
| → Protocol error cause     | Information element value not comprehended        |

## URA UPDATE CONFIRM (Step 3)

Use the same message sub-type found in Annex A, with the following exception:

| Information Element | Value/remark |
|---------------------|--------------|
| RRC State Indicator | CELL_DCH     |

## 8.3.2.10.5 ——— Test Requirement

After step 1 the UE shall detect the expiry of timer T305, then it shall move to CELL\_FACH state and transmit a URA UPDATE message on the uplink CCCH, setting value "periodic URA update" into IE "URA update cause".

After step 3 the UE shall transmit a URA UPDATE message on the uplink CCCH, setting value "TRUE" in IE "URA update cause" and value "Information element value not comprehended" in "Protocol error cause".

### ~~8.3.2.11 URA Update: Cell reselection to cell of another PLMN belonging to the equivalent PLMN list~~

#### ~~8.3.2.11.1 Definition~~

#### ~~8.3.2.11.2 Conformance requirement~~

~~1. A UE in URA\_PCH state shall initiate the URA update procedure in the following cases:~~

~~— URA reselection:~~

- ~~— if the UE detects that the current URA assigned to the UE, stored in the variable URA\_IDENTITY, is not present in the list of URA identities in system information block type 2; or~~
- ~~— if the list of URA identities in system information block type 2 is empty; or~~
- ~~— if the system information block type 2 can not be found:~~
  - ~~— perform URA update using the cause "change of URA".~~

~~2. A "suitable cell" is a cell on which the UE may camp on to obtain normal service. Such a cell shall fulfil all the following requirements:~~

- ~~— The cell is part of the selected PLMN or, of a PLMN considered as equivalent by the UE according to the information provided by the NAS.~~
- ~~— The cell is not barred, see clause 5.3.4.1.~~
- ~~— The cell is not part of the list of "forbidden LAs for roaming" [9]~~
- ~~— The cell selection criteria are fulfilled, see clause 5.2.3.1.2.~~

~~3. The Mobile Equipment shall store a list of "equivalent PLMNs". This list is replaced or deleted at the end of each location update procedure, routing area update procedure and GPRS attach procedure. The stored list consists of a list of equivalent PLMNs as downloaded by the network plus the PLMN code of the network that downloaded the list. The stored list shall not be deleted when the MS is switched off. The stored list shall be deleted if the SIM is removed. The maximum number of possible entries in the stored list is six.~~

#### Reference

3GPP TS 25.331 clause 8.3.1.2.

3GPP TS 25.304 clause 4.3.

3GPP TS 24.008 clause 4.4.1.

#### ~~8.3.2.11.3 Test purpose~~

~~1. To confirm that the UE executes a URA update procedure after a successful reselection of another UTRA cell with a URA identity that is not the URA of the UE and with a PLMN identity different from the original cell but with a PLMN that is part of the equivalent PLMN list in the UE. To confirm that the UE sends the correct uplink response message when executing cell update procedure due to cell reselection.~~

~~NOTE: Verifies conformance requirements 1, 2 and 3.~~

~~2. To confirm that the UE refrains from executing a URA update procedure to a better UTRA cell with another PLMN identity when that PLMN identity is not part of the equivalent PLMN list in the UE.~~

~~NOTE: Test case in 8.3.2.1 is a test where the UE reselects to a cell with the same PLMN identity as the registered PLMN.~~

#### 8.3.2.11.4 Method of test

##### Initial Condition

System Simulator: 3 cells – Cell 1 is active, with the downlink transmission power shown in column marked "T0" in table 8.3.2.1-1, while cell 2 and cell 3 is inactive.

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108, depending on the CN domain(s) supported by the UE.

UE: Shall have stored equivalent PLMN list containing PLMN-1 and PLMN-2. The equivalent PLMN list stored in the UE shall not contain PLMN-3. The UE shall also have stored the URA identity URA-ID 1 from the list of URA-IDs in cell 1.

##### Test Procedure

**Table 8.3.2.11-1**

| Parameter              | Unit | Cell 1   |     |     | Cell 2                 |     |     | Cell 3                 |                        |     |
|------------------------|------|----------|-----|-----|------------------------|-----|-----|------------------------|------------------------|-----|
|                        |      | T0       | T1  | T2  | T0                     | T1  | T2  | T0                     | T1                     | T2  |
| UTRA-RF Channel Number |      | Ch. 1    |     |     | Ch. 1                  |     |     | Ch. 1                  |                        |     |
| PLMN identity          |      | PLMN-1   |     |     | PLMN-2                 |     |     | PLMN-3                 |                        |     |
| URA identity           |      | URA-ID 1 |     |     | URA-ID 2               |     |     | URA-ID 3               |                        |     |
| CPICH RSCP             | dBm  | -73      | -79 | -79 | Cell 2 is switched off | -73 | -79 | Cell 3 is switched off | Cell 3 is switched off | -73 |

Table 8.3.2.11-1 illustrates the downlink power to be applied for the 3 cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions, while columns marked "T1" and "T2" are to be applied subsequently.

- At T0, the SS activates Cell 1.
- At T1, the SS activates Cell 2, and monitors Cell 2 for received messages from UE.
- UE re-selects to Cell 2, and sends a URA UPDATE message
- At T2, the SS activates Cell 3, and monitors Cell 3 for received messages from UE.

##### Expected sequence

| Step | Direction |    | Message                            | Comment                                                                          |
|------|-----------|----|------------------------------------|----------------------------------------------------------------------------------|
|      | UE        | SS |                                    |                                                                                  |
| 1    |           |    |                                    | At T0: UE is camped on Cell 1 and registered to PLMN1                            |
| 2    |           | →  | URA UPDATE                         | At T1: Sent in Cell 2<br>The value "change of URA" set in IE "URA update cause". |
| 3    |           | ←  | URA UPDATE CONFIRM                 |                                                                                  |
| 4    |           | →  | UTRAN-MOBILITY INFORMATION CONFIRM |                                                                                  |

##### Specific Message Contents

FFS

#### 8.3.2.11.5 ~~Test requirement~~

The UE shall send a URA UPATE message after T1 and refrain from sending a URA update (or any other message) after T2.

#### 8.3.2.12 ~~Restricted cell reselection to a cell belonging to forbidden LA list (URA\_PCH)~~

##### 8.3.2.12.1 ~~Definition~~

##### 8.3.2.12.2 ~~Conformance requirement~~

1. A UE in URA\_PCH state shall initiate the URA update procedure in the following cases:

— URA reselection:

- if the UE detects that the current URA assigned to the UE, stored in the variable URA\_IDENTITY, is not present in the list of URA identities in system information block type 2; or
- if the list of URA identities in system information block type 2 is empty; or
- if the system information block type 2 can not be found:
  - perform URA update using the cause "change of URA".

2. A "suitable cell" is a cell on which the UE may camp on to obtain normal service. Such a cell shall fulfil all the following requirements:

- The cell is part of the selected PLMN or, of a PLMN considered as equivalent by the UE according to the information provided by the NAS.
- The cell is not barred, see clause 5.3.4.1.
- The cell is not part of the list of "forbidden LAs for roaming" [9]
- The cell selection criteria are fulfilled, see clause 5.2.3.1.2.

3. The Mobile Equipment shall contain a list of "forbidden location areas for roaming", as well as a list of "forbidden location areas for regional provision of service". These lists shall be erased when the MS is switched off or when the SIM is removed, and periodically (with period in the range 12 to 24 hours). The location area identification received on the BCCH that triggered the location updating request shall be added to the suitable list whenever a location update reject message is received with the cause "Roaming not allowed in this location area" or with the cause "Location Area not allowed". The lists shall accommodate each 10 or more location area identifications. When the list is full and a new entry has to be inserted, the oldest entry shall be deleted.

#### Reference

3GPP TS 25.331 clause 8.3.1.2.

3GPP TS 25.304 clause 4.3.

3GPP TS 24.008 clause 4.4.1.

#### 8.3.2.12.3 ~~Test purpose~~

To confirm that the UE refrains from selects a UTRA cell and performs a URA update if that cell has a LA identity that is part of the list of LAs stored in the UE as "forbidden location areas for roaming".

NOTE: — Test case in 8.3.2.1 is a test where the UE reselects to a cell with the same LA identity as the LA identity in the original cell.

#### 8.3.2.12.4 Method of test

##### Initial Condition

System Simulator: 2 cells – Cell 1 is active, with the downlink transmission power shown in column marked "T0" in table 8.3.2.1-1, while cell 2 is inactive.

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108, depending on the CN domain(s) supported by the UE.

UE: Shall have stored LA-ID 2 into the list of "forbidden location areas for roaming". The UE shall also have stored the URA identity URA-ID 1 from the list of URA-IDs in cell 1.

##### Test Procedure

**Table 8.3.2.12-1**

| Parameter              | Unit | Cell 1   |     | Cell 2                 |     |
|------------------------|------|----------|-----|------------------------|-----|
|                        |      | T0       | T1  | T0                     | T1  |
| UTRA-RF Channel Number |      | Ch. 1    |     | Ch. 1                  |     |
| URA identity           |      | URA-ID 1 |     | URA-ID 2               |     |
| LA identity            |      | LA-ID 1  |     | LA-ID 2                |     |
| CPICH RSCP             | dBm  | -73      | -79 | Cell 2 is switched-off | -73 |

Table 8.3.2.12-1 illustrates the downlink power to be applied for the 2-cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions, while columns marked "T1" and "T2" are to be applied subsequently.

- a) At T1, verify that the UE does not reselect to cell 2 and not send a URA update in cell 2, although cell 2 is the best cell.

##### Expected sequence

-

##### Specific Message Contents

-

#### 8.3.2.12.5 Test requirement

The UE shall not send a URA UPDATE (or any other message) in Cell 2 after T1.

### 8.3.2.13 URA Update: Change of URA due to HCS Cell Reselection

#### 8.3.2.13.1 Definition

#### 8.3.2.13.2 Conformance requirement

This procedure is to update UTRAN with the current URA of the UE after a change of URA has occurred in URA\_PCH state with HCS parameter applied. It may also be used for supervision of the RRC connection, even if no change of URA takes place.

##### Reference

3GPP TS 25.331 clause 8.3.1.

3GPP TS 25.304 clause 5.2.6.1.4.

3GPP TS 25.304 clause 5.4.3.

### 8.3.2.13.3 ~~Test purpose~~

~~To confirm that the UE can read HCS related SIB information and act upon all HCS parameters. To confirm that the UE executes an URA update procedure after the successful change of URA due to HCS Cell Reselection. To confirm UE responds correctly when it re-selects to a new cell while waiting from URA UPDATE CONFIRM message from SS.~~

### 8.3.2.13.4 ~~Method of test~~

#### Initial Condition

System Simulator: 3 cells – Cell 1 is active with URA-ID 1 and downlink transmission power shown in column marked "T0" in table 8.3.2.11-1. Cell2 with URA-ID 1 and Cell 3 with URA-ID 2 are switched off

UE: URA\_PCH (state 6-13) as specified in clause 7.4 of TS 34.108, depending on the CN domain(s) supported by the UE, with URA-ID 1 from the list of URA-ID in cell 1

#### Specific Message Content

For system information blocks 3, 4, 11 & 12 for Cell 1 (gives IE's which are different from defaults given in 34.108 sec 6.1) to be transmitted before idle update preamble.

#### Contents of System Information Block type 3 (FDD)

| Information Element                              | Value/remark                        |

## Test Procedure

Table 8.3.2.13-1

| Parameter              | Unit | Cell 1 |     |     | Cell 2 |     |     | Cell 3 |     |     |
|------------------------|------|--------|-----|-----|--------|-----|-----|--------|-----|-----|
|                        |      | T0     | T1  | T2  | T0     | T1  | T2  | T0     | T1  | T2  |
| UTRA RF Channel Number |      | Ch. 1  |     |     | Ch. 1  |     |     | Ch. 1  |     |     |
| CPICH RSCP             | dBm  | -61    | -61 | -61 | -80    | -80 | -67 | -80    | -73 | -73 |
| H* (After PenaltyTime) |      | 15     | 15  | 15  | -5     | -5  | 9   | -5     | 3   | 3   |
| R* (After PenaltyTime) |      | -41    | -41 | -41 | -60    | -60 | -47 | -60    | -53 | -53 |

\* this parameter is calculated internally in the UE and is only shown for clarification of the test procedure.

The UE is in the URA\_PCH state and assigned with only 1 URA identity in cell 1: URA-ID 1. SS configures Cell 2 and 3 with power level given in column "T0", and URA-Id 1 and 2 respectively and starts broadcast of BCCH on the primary CCCH in cells 2 and 3. UE shall remain camped on the Cell 1 even after expiry of penalty time i.e. 40 seconds. SS sets downlink transmission power settings according to columns "T1" in table 8.3.2.13-1. SS then adjusts the transmission power again according to 'T1' column. This is expected to cause the UE to perform a cell reselection to cell 3 after at least 40 Seconds (Penalty Time) after the power levels have been changed. UE on performing cell reselection to cell 3 finds that its current URA-ID 1 is not in the new broadcasted list of URA-IDs, it moves to CELL\_FACH state and transmits a URA UPDATE message on the uplink CCCH. After the SS receives this message, it transmits URA UPDATE CONFIRM message which includes the IEs "RRC State Indicator" and "URA-ID" to the UE on the downlink DCCH. The "RRC State Indicator" is set to "URA\_PCH". UE returns to URA\_PCH state in cell 3 without sending a uplink response message. Next SS adjusts the transmission power according to 'T2' column. UE shall re-select to cell 2 after atleast penalty time of 40 seconds, and transmit URA UPDATE message to SS. However, SS do not acknowledge but adjusts the transmission power according to 'T0' column. UE shall perform cell re-selection to cell 1 and then sent URA UPDATE message to SS. Finally SS shall transmit URA UPDATE CONFIRM message to UE.

## Expected sequence

| Step | Direction |    | Message            | Comment                                                                                                                                                                                                                                                                 |
|------|-----------|----|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                    |                                                                                                                                                                                                                                                                         |
| 1    |           |    |                    | The UE is updated with only 1 URA identity carried currently by cell 1. The starting state of the UE is URA_PCH                                                                                                                                                         |
| 2    |           | ←  | BCCH               | SS configures cell 2 (with URA-ID 1) and Cell 3 (with URA-ID 2) and power levels as given in column T0 of table 8.3.2.13-1 and starts transmission of BCCH.                                                                                                             |
| 3    |           |    |                    | UE shall Remain camped on Cell 1 and in URA_PCH state even after expiry of Penalty time.                                                                                                                                                                                |
| 4    |           |    |                    | SS set the power transmission of all cells according to column 'T1' of table 8.3.2.13-1.                                                                                                                                                                                |
| 5    |           | →  | URA UPDATE         | The UE shall perform a cell reselection first after the penalty time to cell 3 and when it finds that its current URA-ID 1 is not in the new broadcasted list of URA-IDs, it shall then transmit this message and set value "change of URA" into IE "URA update cause". |
| 6    |           | ←  | URA UPDATE CONFIRM | Message comprises IE "RRC State Indicator" set "URA_PCH", and also IE "URA Identity" equals to "URA-ID 2".                                                                                                                                                              |
| 7    |           |    |                    | SS set the power transmission of all cells according to column 'T2' of table 8.3.2.13-1.                                                                                                                                                                                |
| 8    |           | →  | URA UPDATE         | In Cell 2                                                                                                                                                                                                                                                               |

| →CHOICE mode                                    | FDD                                                                         |
| →Qqualmin                                       | -20 dB                                                                      |
| →Qrxlevmin                                      | -115 dBm                                                                    |

## URA UPDATE (Step 5, 8 and 10)

| Information Element | Value/remark                                      |
|---------------------|---------------------------------------------------|
| U-RNTI              |                                                   |
| -SRNC Identity      | Check to see if set to '0000-0000-0001'           |
| -S-RNTI             | Check to see if set to '0000-0000-0000-0000-0001' |
| URA Update Cause    | Check to see if set to 'change of URA'            |

## URA UPDATE CONFIRM (Step 6)

Use the same message sub-type found in Annex A, with the following exceptions::

| Information Element | Value/remark |
|---------------------|--------------|
| URA identity        | URA-ID-2     |

## URA UPDATE CONFIRM (Step 11)

Use the same message sub-type found in Annex A, with the following exceptions::

| Information Element | Value/remark |
|---------------------|--------------|
| URA identity        | URA-ID-1     |

## 8.3.2.13.5 Test requirement

After step 4 the UE shall find that URA-ID 2 is not in its maintained list of URA-IDs. After cell reselection, the UE shall move to CELL\_FACH state and transmit URA UPDATE message setting value "change of URA" into IE "URA update cause".

After step 7 the UE shall find that URA-ID 1 is not in its maintained list of URA-IDs. After cell reselection, the UE shall move to CELL\_FACH state and transmit URA UPDATE message setting value "change of URA" into IE "URA update cause".

## 8.3.3. UTRAN Mobility Information

## 8.3.3.1 UTRAN Mobility Information: Success

## 8.3.3.1.1 Definition

## 8.3.3.1.2 Conformance requirement

This procedure is used by the network to assign a new RNTI identity to the UE. It is initiated by the UTRAN when it sends a UTRAN MOBILITY INFORMATION message, which includes a new C-RNTI and/or U-RNTI on the downlink DCCH. The UE starts to use the new identities and transmits an UTRAN MOBILITY INFORMATION CONFIRM message to the UTRAN on the uplink DCCH.

## Reference

3GPP TS 25.331 clause 8.3.3

## 8.3.3.1.3 Test purpose

To confirm that the UE starts to use the new identities after it receives a UTRAN MOBILITY INFORMATION message from the SS.

### 8.3.3.1.4 Method of test

#### Initial Condition

System Simulator: 1 cell

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.

#### Test Procedure

Initially, the UE is in CELL\_FACH state and it has been assigned a C-RNTI and U-RNTI. The SS transmits an UTRAN MOBILITY INFORMATION message which includes new C-RNTI and U-RNTI to the UE. Then the UE shall transmit a UTRAN MOBILITY INFORMATION CONFIRM message as confirmation. SS waits for UE to perform periodic cell updating. When SS received a CELL UPDATE message, SS checks that UE uses the new U-RNTI in the CELL UPDATE message and the new C-RNTI in the MAC header. Then SS sends CELL UPDATE CONFIRM. SS waits for UE to perform periodic cell updating. When SS received a CELL UPDATE message, SS sends CELL UPDATE CONFIRM to end the test procedure.

#### Expected sequence

| Step | Direction |    | Message                            | Comment                                                                                                                                  |
|------|-----------|----|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                    |                                                                                                                                          |
| 1    |           |    |                                    | The initial state of the UE is CELL_FACH state. UE has been allocated both C-RNTI and U-RNTI during RRC connection establishment phase.  |
| 2    |           | ←  | UTRAN MOBILITY INFORMATION         | Contains new C-RNTI and U-RNTI identities and a value for T305 that is different from the value defined in the system information.       |
| 3    |           | →  | UTRAN MOBILITY INFORMATION CONFIRM |                                                                                                                                          |
| 4    |           |    |                                    | SS wait for T305 (same as the value defined in system information) to expire.                                                            |
| 5    |           | →  | CELL UPDATE                        | UE shall trigger cell updating. The message shall indicate the same U-RNTI assigned in the UTRAN MOBILITY INFORMATION message in step 2. |
| 6    |           | ←  | CELL UPDATE CONFIRM                |                                                                                                                                          |
| 7    |           |    |                                    | SS wait for T305 (the new value as specified in step 2) to expire.                                                                       |
| 8    |           | →  | CELL UPDATE                        | UE shall trigger cell updating. The message shall indicate the same U-RNTI assigned in the UTRAN MOBILITY INFORMATION message in step 2. |
| 9    |           | ←  | CELL UPDATE CONFIRM                |                                                                                                                                          |

#### Specific Message Content

##### UTRAN MOBILITY INFORMATION (Step 2)

Use the same message sub-type as in Annex A, with the following exceptions:

| Information Element                                         | Value/remark                                                            |
|-------------------------------------------------------------|-------------------------------------------------------------------------|
| New U-RNTI<br>——→ SRNC Identity<br>——→ S-RNTI<br>New C-RNTI | '0000 0000 0001'<br>'0101 0101 0101 0101 0101'<br>'1010 1010 1010 1010' |
| UE Timers and constants in connected mode<br>——→ T305       | 5 minutes                                                               |

### UTRAN MOBILITY INFORMATION CONFIRM (Step 3)

Only the message type IE is checked in this message.

### CELL UPDATE (Step 5 and 8)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element                                            | Value/remark                                                                                                                                      |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| U-RNTI<br>——→ SRNC Identity<br>——→ S-RNTI<br>Cell Update Cause | Check to see if set to '0000 0000 0001'<br>Check to see if set to '0101 0101 0101 0101 0101'<br>Check to see if set to 'periodical cell updating' |

### CELL UPDATE CONFIRM (Step 6 and 9)

Use the same message sub-type as in Annex A.

#### 8.3.3.1.5 Test requirement

After step 2 the UE shall transmit a UTRAN MOBILITY INFORMATION CONFIRM message on the uplink DCCH.

After step 4 and 7 the UE shall transmit a CELL UPDATE message on the uplink CCCH with IE "Cell update cause" set to "periodical cell updating". The IE "U-RNTI" shall be identical to the IE "New RNTI" found in UTRAN MOBILITY INFORMATION message sent by the SS in step 2.

### 8.3.3.2 UTRAN Mobility Information: Failure (Invalid message reception)

#### 8.3.3.2.1 Definition

#### 8.3.3.2.2 Conformance Requirements

When the UE receives an invalid UTRAN MOBILITY INFORMATION message, it shall transmit a UTRAN MOBILITY INFORMATION FAILURE message on the DCCH using AM RLC and set the value "protocol error" in the IE "failure cause". The IE "protocol error information" in this message shall also be set to an appropriate value. The UE shall not utilize any identities relayed in the erroneous message, and it shall resume normal operations.

#### 8.3.3.2.3 Test Purpose

To confirm that the UE ignore the erroneous UTRAN MOBILITY INFORMATION message and report this event to the UTRAN by sending UTRAN MOBILITY INFORMATION FAILURE message, stating the appropriate failure cause and information.

#### 8.3.3.2.4 Method of test

#### Initial Conditions

System Simulator: 1 cell.

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108.

### Test Procedure

The UE is brought to CELL\_FACH state. SS transmits a UTRAN MOBILITY INFORMATION message to the UE on the DCCH using AM-RLC mode. In this message, the all IEs except "Message Type" are not present. The UE shall respond by transmitting the UTRAN MOBILITY INFORMATION FAILURE message, indicating "protocol error" in IE "failure cause" and also "ASN.1 violation and encoding error" in IE "Protocol error information". After receiving the UTRAN MOBILITY INFORMATION FAILURE message, SS waits for T305 to expire. The UE shall transmit a CELL UPDATE message with the original U-RNTI identity assigned. SS sends CELL UPDATE CONFIRM message to the UE on the downlink DCCH.

### Expected Sequence

| Step | Direction |    | Message                            | Comment                                                                                                                                          |
|------|-----------|----|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                    |                                                                                                                                                  |
| 1    |           |    |                                    | The initial state of the UE is CELL_FACH state.                                                                                                  |
| 2    |           | ←  | UTRAN MOBILITY INFORMATION         | See specific message content.                                                                                                                    |
| 3    |           | →  | UTRAN MOBILITY INFORMATION FAILURE | UE shall transmit this message to report the error in UTRAN MOBILITY INFORMATION message. It shall include the appropriate cause in the message. |
| 4    |           |    |                                    | SS waits for a period up to timer T305 to allow the UE to start performing a cell updating procedure.                                            |
| 5    |           | →  | CELL UPDATE                        |                                                                                                                                                  |
| 6    |           | ←  | CELL UPDATE CONFIRM                |                                                                                                                                                  |

#### CELL UPDATE (Step 5)

The same message found in Annex A shall be transmitted by the UE on the uplink CCCH, with the exception of the following IEs:

| Information Element | Value/remark                                       |
|---------------------|----------------------------------------------------|
| U-RNTI              |                                                    |
| ——→ SRNC Identity   | Check to see if set to '0000-0000-0001'B           |
| ——→ S-RNTI          | Check to see if set to '0000-0000-0000-0000-0001'B |
| Cell update-cause   | Check to see if set to 'periodical-cell-updating'  |

### CELL UPDATE CONFIRM (Step 6)

Use the same message sub-type as in Annex A.

#### 8.3.3.2.5 ————— Test Requirement

After step 2 the UE shall transmit UTRAN MOBILITY INFORMATION FAILURE message, indicating the value "protocol error" in IE "failure-cause" and also "ASN.1 violation and encoding error" in IE "protocol error information".

After step 4 the UE shall initiate a periodic cell updating procedure by transmitting CELL UPDATE message on the CCCH. In this message, the U-RNTI identity shall be set to the same value as assigned during the RRC connection establishment procedure.

### 8.3.4 — Active set update in soft handover

#### 8.3.4.1 — Active set update in soft handover: Radio Link addition

##### 8.3.4.1.1 ————— Definition

##### 8.3.4.1.2 ————— Conformance requirement

Radio link addition is triggered in the network's RRC layer. The RRC entity in the network first configures the new radio link. Transmission and reception then begin immediately. This procedure is to update the active set of the connection between the UE and UTRAN. The UTRAN then transmits an ACTIVE SET UPDATE message to the UE. The UE configures layer 1 to begin reception for the additional radio link. After the UE receives confirmation from the physical layer in the UE, an ACTIVE SET UPDATE COMPLETE message is sent to the UTRAN.

#### Reference

3GPP TS 25.331 clause 8.3.4

##### 8.3.4.1.3 ————— Test purpose

To confirm that the UE continues to communicate with the SS on both the additional radio link and an already existing radio link after the radio link addition.

##### 8.3.4.1.4 ————— Method of test

#### Initial Condition

System Simulator: 2 cells – Cell 1 and 2 are active

UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

Test Procedure

Table 8.3.4.1

| Parameter                    | Unit                | Cell 1 |     |     |     | Cell 2 |     |     |     |
|------------------------------|---------------------|--------|-----|-----|-----|--------|-----|-----|-----|
|                              |                     | T0     | T1  | T2  | T3  | T0     | T1  | T2  | T3  |
| UTRA—RF<br>Channel<br>Number |                     | Ch. 1  |     |     |     | Ch. 1  |     |     |     |
| CPICH Ec                     | dBm/<br>3.84<br>MHz | -60    | -60 | OFF | -60 | -75    | -60 | -60 | OFF |

Table 8.3.4.1 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution.

Initially, the UE establishes a radio-access bearer in CELL\_DCH state in cell 1. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.1. UE shall be triggered to transmit a MEASUREMENT REPORT message which includes the primary scrambling code for cell 2 according to IE "Intra-frequency event identity", which is set to '1a' in the SYSTEM INFORMATION BLOCK TYPE 11. After the MEASUREMENT REPORT message is received, the SS begins to configure the new radio link to be added from cell 2 and then the SS transmits to the UE an ACTIVE SET UPDATE message in cell 1 on DCCH using AM RLC which includes the IE "Radio Link Addition Information" (e.g. Downlink DPCH information and other optional parameters relevant for the additional radio links with Primary CPICH info used for the reference ID). When the UE receives this message, the UE shall configure layer 1 to begin reception without affecting the current uplink and downlink activities of existing radio links. The UE shall transmit an ACTIVE SET UPDATE COMPLETE message to the SS on the uplink DCCH using AM RLC. SS configures its downlink transmission power settings according to columns "T2" in table 8.3.4.1. UE shall not detect the DPCH from cell 1 but continue to communicate through the another DPCH from cell 2. SS shall transmit a UE CAPABILITY ENQUIRY message to confirm that the UE can respond this message through the DPCH in cell 2. The UE shall transmit a UE CAPABILITY ENQUIRY INFORMATION message. Then SS transmits a UE CAPABILITY INFORMATION CONFIRM message. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.1. UE shall detect DPCH from cell 1 and 2. And then SS configures its downlink transmission power settings according to columns "T3" in table 8.3.4.1. UE shall not detect the DPCH from cell 2 but continue to communicate through another DPCH from cell 1. SS shall transmit a UE CAPABILITY ENQUIRY message to confirm that the UE can respond this message through the DPCH in cell 1. The UE shall transmit a UE CAPABILITY ENQUIRY INFORMATION message. Then SS transmits a UE CAPABILITY INFORMATION CONFIRM message.

#### Expected sequence

| Step | Direction |    | Message                           | Comment                                                                                                                                                                                                                                                                                          |

### ACTIVE SET UPDATE

The message to be used in this test is defined in Annex A, with the following exceptions:

| Information Element               | Value/remark                                       |
|-----------------------------------|----------------------------------------------------|
| Radio link addition information   |                                                    |
| —— Primary CPICH Info             |                                                    |
| —— Primary Scrambling Code        | 150                                                |
| —— Downlink DPCH info for each RL |                                                    |
| —— DPCH frame offset              | Calculated value from COUNT-C-SFN frame difference |

#### 8.3.4.1.5 Test requirement

After step 1 the UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH using AM RLC.

After step 3 the UE shall transmit an ACTIVE SET UPDATE COMPLETE message on the uplink DCCH using AM RLC to acknowledge the completion of the active set additional procedure.

After step 6 the UE shall transmit a UE CAPABILITY INFORMATION message.

After step 11 the UE shall transmit a UE CAPABILITY INFORMATION message.

~~8.3.4.2 Active set update in soft handover: Radio Link removal~~

~~8.3.4.2.1 Definition~~

~~8.3.4.2.2 Conformance requirement~~

~~This procedure is to update the active set of the connections between the UE and the UTRAN after the UTRAN has commanded a removal of a radio link from the current active set. The UTRAN RRC transmits an ACTIVE SET UPDATE message to the UE RRC. The UE RRC requests UE L1 to terminate transmission and reception of the radio link to be removed. The UE shall continue to communicate normally with the UTRAN using the new active set, without losing the connection link. After this the UE acknowledges the radio link removal by sending an ACTIVE SET UPDATE COMPLETE message to the UTRAN on DCCH using AM RLC.~~

~~Reference~~

~~3GPP TS 25.331 clause 8.3.4~~

~~8.3.4.2.3 Test purpose~~

~~To confirm that the UE continues to communicate with the SS on the remaining radio link after radio link removal on the active set.~~

~~8.3.4.2.4 Method of test~~

~~Initial Condition~~

~~System Simulator: 2 cells – both Cell 1 and Cell 2 are active~~

~~UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.~~

~~Test Procedure~~

**Table 8.3.4.2**

| Parameter              | Unit        | Cell 1 |     |     |     | Cell 2 |     |     |     |
|------------------------|-------------|--------|-----|-----|-----|--------|-----|-----|-----|
|                        |             | T0     | T1  | T2  | T3  | T0     | T1  | T2  | T3  |
| UTRA RF Channel Number |             | Ch. 1  |     |     |     | Ch. 1  |     |     |     |
| CPICH-Ec               | dBm/3.84MHz | -60    | -60 | -75 | -60 | -75    | -60 | -60 | OFF |

Table 8.3.4.2 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution.

At the start of the test, the UE establishes a radio access bearer service in the CELL\_DCH state in cell 1. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.2. UE shall be triggered to transmit a MEASUREMENT REPORT message which includes the primary scrambling code for cell 2 according to IE "Intra-frequency event identity", which is set to '1a' in the SYSTEM INFORMATION BLOCK TYPE 11. After the MEASUREMENT REPORT message is received, the SS begins to configure the new radio link to be added from cell 2 and then the SS transmits to the UE an ACTIVE SET UPDATE message in cell 1 on DCCH using AM RLC which includes the IE "Radio Link Addition Information" (e.g. Downlink DPCH information and other optional parameters relevant for the additional radio links with Primary CPICH info used for the reference ID). When the UE receives this message, the UE shall configure layer 1 to begin reception without affecting the current uplink and downlink activities of existing radio links. The UE shall transmit an ACTIVE SET UPDATE COMPLETE message to the SS on the uplink DCCH using AM RLC. SS configures its downlink transmission power settings according to columns "T2" in table 8.3.4.2. UE shall transmit a MEASUREMENT REPORT message which includes the primary scrambling code for cell 1 according to IE "Intra-frequency event identity", which is set to '1b' in the SYSTEM INFORMATION BLOCK TYPE 11. After the MEASUREMENT REPORT message is received, the SS remove the radio link from cell 1 and then

SS transmits an ACTIVE SET UPDATE message, which includes IE "Radio Link Removal Information" and specifying the P-CPICH information of the cell to be removed. When the UE receives this message, the UE RRC entity shall request UE L1 entity to terminate transmission and reception of the radio link from cell 1. Then the UE transmits an ACTIVE SET UPDATE COMPLETE message to the SS on the uplink DCCH using AM RLC. SS shall transmit a UE CAPABILITY ENQUIRY message to confirm that the UE can respond this message through the DPCH in cell 2. The UE shall transmit a UE CAPABILITY ENQUIRY INFORMATION message. Then SS transmits a UE CAPABILITY INFORMATION CONFIRM message. SS configures its downlink transmission power settings according to columns "T3" in table 8.3.4.2 so as to generate a radio link failure condition. The UE shall detect the radio link failure and transmit a CELL UPDATE message to re-establish an RRC CONNECTION.

#### Expected sequence

| Additional measured results         | Checked that this IE is absent                                                                                                                                                                                                                     |
| Event results                       | Checked that this IE is absent                                                                                                                                                                                                                     |

**ACTIVE SET UPDATE (Step 7)**

The message to be used in this test is the same as the message sub-type found in Annex A, with the following exceptions:

| Information Element            | Value/remark                                                |
|--------------------------------|-------------------------------------------------------------|
| Radio link removal information | 1 radio link to be removed                                  |
| —— Primary CPICH info          | Set to the same P-CPICH scrambling code assigned for cell 1 |
| —— Primary scrambling code     |                                                             |

**CELL UPDATE (Step 13)**

The contents of CELL UPDATE message is identical as "Contents of CELL UPDATE message" as found in Annex A with the following exceptions:

| Information Element | Value/remark         |
|---------------------|----------------------|
| Cell Update Cause   | "radio link failure" |

**8.3.4.2.5 Test requirement**

After step 1 the UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH using AM RLC.

After step 3 the UE shall transmit an ACTIVE SET UPDATE COMPLETE message on the uplink DCCH using AM RLC to acknowledge the completion of the active set additional procedure.

After step 5 the UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH using AM RLC.

After step 7 the UE shall remove the radio link from cell 1 and it shall transmit an ACTIVE SET UPDATE COMPLETE message on the uplink DCCH using AM RLC.

After step 10 the UE shall transmit a UE CAPABILITY INFORMATION message.

After step 12 the UE shall transmit a CELL UPDATE message on the CCCH with IE "Cell update cause" set to "radio link failure".

~~8.3.4.3 Active set update in soft handover: Combined radio link addition and removal~~

~~8.3.4.3.1 Definition~~

~~8.3.4.3.2 Conformance requirement~~

~~When radio links are to be replaced, the UTRAN RRC first configures the UTRAN L1 to activate the radio link(s) that are being added. The UTRAN RRC then transmits an ACTIVE SET UPDATE message to the UE RRC, which shall configure the UE L1 to terminate transmission and reception on the removed radio link(s) and begin transmission and reception on the added radio link(s). At the completion of the reconfiguration of radio links, the UE shall acknowledge the replacement with an ACTIVE SET UPDATE COMPLETE message.~~

Reference

3GPP TS 25.331 clause 8.3.4

~~8.3.4.3.3 Test purpose~~

~~To confirm that the UE continues to communicate with the SS on the added radio link and removes radio link which exists prior to the execution of active set update procedure.~~

~~8.3.4.3.4 Method of test~~

Initial Condition

System Simulator: 2 cells- Both Cell 1 and Cell 2 are active

UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE [Active set is not full.]

Test Procedure

Table 8.3.4.3

| Parameter              | Unit        | Cell 1 |     |     | Cell 2 |     |     |
|------------------------|-------------|--------|-----|-----|--------|-----|-----|
|                        |             | T0     | T1  | T2  | T0     | T1  | T2  |
| UTRA RF Channel Number |             | Ch. 1  |     |     | Ch. 1  |     |     |
| CPICH Ec               | dBm/3.84MHz | -60    | -60 | -60 | -75    | -60 | OFF |

Table 8.3.4.3 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution:

The UE establishes a radio access bearer in the CELL\_DCH state in cell 1. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.3. UE shall be triggered to transmit a MEASUREMENT REPORT message which includes the primary scrambling code for cell 2 according to IE "Intra-frequency event identity", which is set to '1a' in the SYSTEM INFORMATION BLOCK TYPE 11. After the MEASUREMENT REPORT message is received, the SS begins to configure the new radio link to be added from cell 2 and then the SS transmits to the UE in cell 1 an ACTIVE SET UPDATE message which includes IE "Radio Link Addition Information" and IE "Radio Link Removal Information", indicating the removal of cell 1 and addition of cell 2 into the active set, on DCCH using AM RLC. When the UE receives this message, the UE shall configure layer 1 to begin reception without affecting the current uplink and downlink activities of existing radio links and then the UE removes the radio link specified in an ACTIVE SET UPDATE message. The UE shall transmit an ACTIVE SET UPDATE COMPLETE message to the SS on the uplink DCCH using AM RLC. SS removes the radio link in cell 1. SS shall transmit a UE CAPABILITY ENQUIRY message to confirm that the UE can respond this message through the DPCCH in cell 2. The

UE shall transmit a UE CAPABILITY ENQUIRY INFORMATION message. Then SS transmits a UE CAPABILITY INFORMATION CONFIRM message. SS configures its downlink transmission power settings according to columns "T2" in table 8.3.4.3 so as to generate a radio link failure condition. The UE shall detect the radio link failure and transmit a CELL UPDATE message to re-establish an RRC CONNECTION.

#### Expected sequence

| Step | Direction |    | Message                           | Comment                                                                                                                                                                       |

## ACTIVE SET UPDATE (Step 3)

The message to be used in this test is defined in Annex A, with the following exceptions:

| Information Element               | Value/remark                                       |
|-----------------------------------|----------------------------------------------------|
| Radio link addition information   | Set to same code as assigned for cell 2            |
| —— Primary CPICH Info             |                                                    |
| —— Primary Scrambling Code        |                                                    |
| —— Downlink DPCH info for each RL |                                                    |
| —— DPCH frame offset              | Calculated value from COUNT-C-SFN frame difference |
| Radio link removal information    | Set to same code as assigned for cell 1            |
| —— Primary CPICH Info             |                                                    |
| —— Primary Scrambling Code        |                                                    |

## CELL UPDATE (Step 9)

The contents of CELL UPDATE message is identical as "Contents of CELL UPDATE message" as found in Annex A with the following exceptions:

| Information Element | Value/remark         |
|---------------------|----------------------|
| Cell Update Cause   | "radio link failure" |

## 8.3.4.3.5 ——— Test requirement

After step 1 the UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH using AM RLC.

After step 3 the UE shall transmit an ACTIVE SET UPDATE COMPLETE message on the uplink DCCH.

After step 5 the UE shall a UE CAPABILITY INFORMATION message.

After step 8 the UE shall transmit a CELL UPDATE message on the CCCH with IE "Cell update cause" set to "radio link failure".

~~8.3.4.4 Active set update in soft handover: Invalid Configuration~~

~~8.3.4.4.1 Definition~~

~~8.3.4.4.2 Conformance requirement~~

If the UTRAN attempts to add a radio link but the additional radio link is specified in both IE "Radio Link Addition Information" and IE "Radio Link Removal Information", the UE transmits an ACTIVE SET UPDATE FAILURE message on the DCCH using AM RLC and maintain its current communication status with the radio links.

Reference

3GPP TS 25.331 clause 8.3.4

~~8.3.4.4.3 Test purpose~~

To confirm that the UE transmits an ACTIVE SET UPDATE FAILURE message on the DCCH using AM RLC, if the received ACTIVE SET UPDATE message includes a radio link which is specified in both IE "Radio Link Addition Information" and IE "Radio Link Removal Information".

~~8.3.4.4.4 Method of test~~

Initial Condition

System Simulator: 2 cells – Cell 1 and 2 are active.

UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

Test Procedure

Table 8.3.4.4

| Parameter              | Unit         | Cell 1 |     | Cell 2 |     |
|------------------------|--------------|--------|-----|--------|-----|
|                        |              | T0     | T1  | T0     | T1  |
| UTRA RF Channel Number |              | Ch. 1  |     | Ch. 1  |     |
| CPICH E <sub>c</sub>   | dBm/3.84 MHz | -60    | -75 | -60    | -60 |

Table 8.3.4.4 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution.

The UE establishes a radio access bearer in the CELL\_DCH state in cell 1. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.4. UE shall be triggered to transmit a MEASUREMENT REPORT message which includes the primary scrambling code for cell 2 according to IE "Intra-frequency event identity", which is set to '1a' in the SYSTEM INFORMATION BLOCK TYPE 11. SS then transmits an ACTIVE SET UPDATE message in cell 1 on DCCH using AM RLC which includes the same primary scrambling code in IE "Primary CPICH Info" of both IE "Radio Link Addition Information" and IE "Radio Link Removal Information". When the UE receives this message, it transmits an ACTIVE SET UPDATE FAILURE message which is set to "Invalid configuration" in IE "failure cause" on the uplink DCCH using AM RLC to the SS.

## Expected sequence

| Step | Direction |    | Message                   | Comment                                                                                                                                                                                                                      |
|------|-----------|----|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 4    |           | →  | ACTIVE SET UPDATE FAILURE | The message shall state "Invalid configuration" in IE "failure cause".                                                                                                                                                       |

## Specific Message Contents

## ACTIVE SET UPDATE (Step 3)

The message to be used in this test is defined in the default message content clause, with the following exceptions:

| Information Element                                                                                          | Value/remark                                                                                                                |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Radio link addition information<br>→ Primary CPICH Info<br>→ Primary Scrambling Code<br>→ DPCCH frame offset | Set to same code as assigned for cell 2<br>Calculated value from COUNT-C-SFN frame difference<br>1 radio link to be removed |
| Radio link removal information<br>→ Primary CPICH info<br>→ Primary scrambling code                          | Set to same code as assigned for cell 2                                                                                     |

## ACTIVE SET UPDATE FAILURE (Step 4)

| Information Element  | Value/remark                                        |
|----------------------|-----------------------------------------------------|
| Integrity check info | Not Checked                                         |
| Failure cause        | Check to see if it's set to 'Invalid configuration' |

## 8.3.4.4.5 → Test requirement

After step 1 the UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH using AM RLC.

After step 3 the UE shall transmit an ACTIVE SET UPDATE FAILURE message, setting "Invalid configuration" in IE "failure cause" and sent on the uplink DCCH using AM RLC.

## 8.3.4.5 → Active set update in soft handover: Reception of an ACTIVE SET UPDATE message in wrong state

## 8.3.4.5.1 → Definition

## 8.3.4.5.2 → Conformance requirement

If the UE is in another state than CELL\_DCH state upon reception of the ACTIVE SET UPDATE message, the UE shall transmit an ACTIVE SET UPDATE FAILURE message on the uplink DCCH using AM RLC.

## Reference

3GPP TS 25.331 clause 8.3.4

## 8.3.4.5.3 Test purpose

To confirm that the UE transmit an ACTIVE SET UPDATE FAILURE message when it receives an ACTIVE SET UPDATE message in any state other than CELL\_DCH.

## 8.3.4.5.4 Method of test

## Initial Condition

System Simulator: 2 cells — Cell 1 and 2 are active.

UE: PS-DCCCH+DTCH\_FACH (state 6-11) in cell 1 as specified in clause 7.4 of TS 34.108.

## Test Procedure

Table 8.3.4.5

| Parameter                | Unit         | Cell 1 |     | Cell 2 |     |
|--------------------------|--------------|--------|-----|--------|-----|
|                          |              | T0     | T1  | T0     | T1  |
| UTRA — RF Channel Number |              | Ch. 1  |     | Ch. 1  |     |
| CPICH Ec                 | dBm/3.84 MHz | -60    | -75 | -60    | -60 |

Table 8.3.4.5 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution.

At the start of the test, the UE establishes a radio access bearer service in the CELL\_FACH state in cell 1. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.2. SS begins to configure the new radio link to be added from cell 2 and then the SS transmits to the UE an ACTIVE SET UPDATE message in cell 1 on DCCH using AM RLC which includes the IE "Radio Link Addition Information" indicating the addition of cell 2 into the active set. When the UE receives this message, UE shall transmit ACTIVE SET UPDATE FAILURE message, with the IE "failure cause" set to the cause value "protocol error" and includes the IE "Protocol error information" with the IE "Protocol error cause" set to "Message not compatible with receiver state", on the uplink DCCH using AM RLC.

## Expected sequence

| Step | Direction |    | Message                   | Comment                                                                                                                                                                                             |
|------|-----------|----|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                           |                                                                                                                                                                                                     |
| 1    |           |    |                           | SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.5                                                                                                   |
| 2    |           |    | Void                      |                                                                                                                                                                                                     |
| 3    |           | ←  | ACTIVE SET UPDATE         | The SS transmit this message on downlink DCCH using AM RLC which includes IE "Radio Link Addition Information".                                                                                     |
| 4    |           | →  | ACTIVE SET UPDATE FAILURE | IE "failure cause" set to the cause value "protocol error" and includes the IE "Protocol error information" with the IE "Protocol error cause" set to "Message not compatible with receiver state". |

## Specific Message Content

### ACTIVE SET UPDATE

The message to be used in this test is defined in Annex A, with the following exceptions:

| Information Element                        | Value/remark |
|--------------------------------------------|--------------|
| <del>Radio link addition information</del> |              |
| <del>Primary CPICH Info</del>              |              |
| <del>Primary Scrambling Code</del>         | 150          |
| <del>Downlink DPCH info for each RL</del>  |              |
| <del>DPCH frame offset</del>               | 0            |

#### 8.3.4.5.5 ~~Test requirement~~

After step 1, the UE shall not transmit MEASUREMENT REPORT message.

After step 3 the UE shall transmit an ACTIVE SET UPDATE FAILURE message on the DCCH. In this message, the value "Message not compatible with receiver state" shall be set in IE "Protocol Error Information".

#### 8.3.4.6 ~~Void~~

#### 8.3.4.7 ~~Active set update in soft handover: Invalid Message Reception~~

##### 8.3.4.7.1 ~~Definition~~

##### 8.3.4.7.2 ~~Conformance Requirement~~

The UE shall keep its old configuration when the UE receives an ACTIVE SET UPDATE message, which does not include any IEs except IE "Message Type" and transmit an ACTIVE SET UPDATE FAILURE message which set value "protocol error" in IE "failure cause" and also value "ASN.1 violation or encoding error" in IE "Protocol error cause".

### Reference

3GPP TS 25.331 clause 8.3.4

##### 8.3.4.7.3 ~~Test Purpose~~

To confirm that the UE retains its active set list and transmits an ACTIVE SET UPDATE FAILURE message when it receives an invalid ACTIVE SET UPDATE message.

##### 8.3.4.7.4 ~~Method of test~~

### Initial Condition

System Simulator: 2 cells — both cell 1 and cell 2 are active.

UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE (Integrity protection algorithm is not applied at the start of test)

## Test Procedure

Table 8.3.4.7

| Parameter              | Unit         | Cell 1 |     | Cell 2 |     |
|------------------------|--------------|--------|-----|--------|-----|
|                        |              | T0     | T1  | T0     | T1  |
| UTRA—RF Channel Number |              | Ch. 1  |     | Ch. 1  |     |
| CPICH Ec               | dBm/3.84 MHz | -60    | -75 | -60    | -60 |

Table 8.3.4.7 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution.

The UE establishes a radio access bearer in CELL\_DCH in cell 1. SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.7. UE shall be triggered to transmit a MEASUREMENT REPORT message which includes the primary scrambling code for cell 2 according to IE "Intra-frequency event identity", which is set to '1a' in the SYSTEM INFORMATION BLOCK TYPE 11. SS transmits an ACTIVE SET UPDATE message which does not include any IEs except IE "Message Type". The UE shall transmit an ACTIVE SET UPDATE FAILURE message, stating the reason "ASN.1 violation or encoding error" in the IE "Protocol error information".

## Expected Sequence

| Step | Direction |    | Message                   | Comment                                                                                                             |
|------|-----------|----|---------------------------|---------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                           |                                                                                                                     |
| 1    |           |    |                           | SS configures its downlink transmission power settings according to columns "T1" in table 8.3.4.7                   |
| 2    | →         |    | MEASUREMENT REPORT        |                                                                                                                     |
| 3    | ←         |    | ACTIVE SET UPDATE         | The SS transmits this message on downlink DCCH using AM RLC which does not include any IEs except IE "Message Type" |
| 4    | →         |    | ACTIVE SET UPDATE FAILURE | The message shall state "ASN.1 violation error or encoding error" in IE "protocol error information".               |

## Specific Message Contents

## ACTIVE SET UPDATE (Step 3)

| Information Element | Value/remark |
|---------------------|--------------|
| All IEs             | Not Present  |

## ACTIVE SET UPDATE FAILURE (Step 4)

| Information Element                                  | Value/remark                      |
|------------------------------------------------------|-----------------------------------|
| Protocol Error Information<br>→ Protocol Error Cause | ASN.1 violation or encoding error |

## 8.3.4.7.5 ——— Test Requirement

After step 1 the UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH using AM RLC.

After step 3 the UE shall transmit an ACTIVE SET UPDATE FAILURE message on the DCCH. In this message, the value "ASN.1 violation or encoding error" shall be set in IE "Protocol Error Information".

### ~~8.3.5 Hard Handover~~

~~[Editor's note: This test is included in the "Physical channel reconfiguration", "Radio bearer establishment", "Radio bearer reconfiguration", "Radio bearer release" and "Transport channel reconfiguration".]~~

### ~~8.3.6 Inter-system hard handover from GSM to UTRAN~~

~~The content of this clause has been moved to 3GPP TS 51.010-1, clause 60.~~

### ~~8.3.7 Inter-system hard handover from UTRAN to GSM~~

~~Clauses 8.3.7 contains test procedures to be used for executing Inter-system Handover from UTRAN to GSM tests. Table 8.3.7-1 contains a summary of the different combinations of parameters being tested, together with a reference to the appropriate generic test procedure. If a test uses a parameter which the UE under test does not support, the test shall be skipped. Test cases in this clause are applicable only to the UE supporting both UTRAN and GSM. The test TEST USIM shall support service 27 to carry out these test cases.~~

Table 8.3.7-1

### ~~8.3.7.1 Inter system handover from UTRAN/To GSM/Speech/Success~~

#### ~~8.3.7.1.1 Definition~~

#### ~~8.3.7.1.2 Conformance requirement~~

When the UE receives an ~~HANDOVER FROM UTRAN COMMAND~~ message from UTRAN the UE shall take the following actions:

- ~~— Establish the connection to the other radio access system, by using the contents of the IE "Inter-system message". This IE contains candidate/ target cell identifier(s) and radio parameters relevant for the other radio access system.~~
- ~~— For each IE "Remaining radio access bearer", associate the radio access bearer given by the IE "RAB info" to the radio resources in the target system given by the IE "Inter-system message". Other information for making the association may be included in the IE "Inter-system message" and requirements may be stated in the specifications relevant for the target system [FFS].~~
- ~~— Switch the current connection to the other radio access system.~~

~~NOTE 1: Requirements concerning the establishment of the radio connection towards the other radio access system and the signalling procedure are outside the scope of the present document.~~

~~NOTE 2: The release of the UMTS radio resources is initiated by the other system.~~

~~NOTE 3: Currently only one radio access bearer can be associated with the IE "Inter-system message", and this association is limited to the radio access bearers in the CS domain. It is assumed that all the radio access bearers in the PS domain, if any, remain after the handover.~~

#### Reference(s)

TS 25.331 clause 8.3.7.3.

#### 8.3.7.1.3 ~~Test purpose~~

To test that the UE supporting both GSM and UTRAN handovers from a UTRAN serving cell to the indicated channel of GSM target cell when the UE is in the speech call active state and receives an HANDOVER FROM UTRAN COMMAND.

#### 8.3.7.1.4 ~~Method of test~~

#### Initial conditions

System Simulator : 2 cells – Cell 1 is UTRAN, Cell 2 is GSM. GSM 51.010 clause 26.6.5.1 shall be referenced for the default parameters of cell 2.

UE : CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

- ~~— UE supports both GSM and UTRAN Radio Access Technologies,~~
- ~~— UE supports GSM ARM,~~
- ~~— UE supports GSM EFR,~~
- ~~— UE supports GSM HR,~~
- ~~— UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.~~

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 2.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into call active state (CC state U10) with AMR. The SS starts GSM cell and configures a traffic channel, then sends HANDOVER FROM UTRAN COMMAND indicating the traffic channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. After the UE receives the command it shall configure itself accordingly and switch to the new channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the UE transmits the HANDOVER COMPLETE message to the SS through GSM cell.

Depending on the PIXIT parameters the above procedure is executed maximum four times, each time with different target channel in the GSM cell.

#### Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, 4, depending on the PIXIT parameters.

| —— CHOICE system               | Single GSM message                                                                                                                                                                                                                       |
| —— Message                     | GSM HANDOVER COMMAND formatted as Variable Length BIT STRING without Length Indicator. The contents of the HANDOVER COMMAND see next table.                                                                                              |

#### HANDOVER COMMAND

Same as the HANDOVER COMMAND for M = 4 in clause 26.6.5.1 of GSM 51.010, except that the CHANNEL MODE IE is included with value = speech full rate or half rate version 1

#### 8.3.7.1.5 ——— Test requirement

After step 12 the ongoing call shall be continued on the GSM cell.

#### 8.3.7.2 ——— Inter system handover from UTRAN/To GSM/Data/Same data rate/Success

##### 8.3.7.2.1 ——— Definition

##### 8.3.7.2.2 ——— Conformance requirement

When the UE receives an HANDOVER FROM UTRAN COMMAND message from UTRAN the UE shall take the following actions:

- Establish the connection to the other radio access system, by using the contents of the IE "Inter system message". This IE contains candidate/ target cell identifier(s) and radio parameters relevant for the other radio access system.
- For each IE "Remaining radio access bearer", associate the radio access bearer given by the IE "RAB info" to the radio resources in the target system given by the IE "Inter system message". Other information for making the association may be included in the IE "Inter system message" and requirements may be stated in the specifications relevant for the target system [FFS].
- Switch the current connection to the other radio access system.

NOTE 1: Requirements concerning the establishment of the radio connection towards the other radio access system and the signalling procedure are outside the scope of the present document.

NOTE 2: The release of the UMTS radio resources is initiated by the other system.

NOTE 3: Currently only one radio access bearer can be associated with the IE "Inter-system message", and this association is limited to the radio access bearers in the CS domain. It is assumed that all the radio access bearers in the PS domain, if any, remain after the handover.

#### Reference(s)

TS 25.331 Clause 8.3.7.3.

#### 8.3.7.2.3 Test purpose

To test that the UE handovers to the indicated channel of same data rate in the GSM target cell when it is in the data call active state in the UTRAN serving cell and receives an HANDOVER FROM UTRAN COMMAND.

#### 8.3.7.2.4 Method of test

#### Initial conditions

System Simulator : 2 cells – Cell 1 is UTRAN, Cell 2 is GSM. GSM 51.010 clause 26.6.5.1 or clause 26.13.1.3 (for HSCSD) shall be referenced for the default parameters of cell 2.

UE : CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

- UE supports both GSM and UTRAN Radio Access Technologies;
- UE supports UTRAN Streaming/unknown/uplink:14.4 DL:14.4 kbps/CS RAB + uplink:3.4 DL:3.4 kbps SRBs;
- UE supports UTRAN Streaming/unknown/uplink:28.8 DL:28.8 kbps/CS RAB + uplink:3.4 DL:3.4 kbps SRBs;
- UE supports UTRAN Streaming/unknown/uplink:57.6 DL:57.6 kbps/CS RAB + uplink:3.4 DL:3.4 kbps SRBs;
- UE supports GSM 14.4 kbps data (HSCSD or full rate traffic channel for 14.4 kbit/s user data (TCH/F14.4));
- UE supports GSM 28.8 kbps data (HSCSD or enhanced circuit switched full rate traffic channel for 28.8 kbit/s user data (E-TCH/F28.8));
- UE supports GSM 57.6 kbps data;
- UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 2.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into data call active state (CC state U10) with a suitable configuration (e.g. Streaming/unknown/uplink:14.4 DL:14.4 kbps/CS RAB + uplink:3.4 DL:3.4 kbps SRBs for M = 1). The SS starts GSM cell and configures a traffic channel (e.g. 14.4 kbps data channel for M = 1), then sends HANDOVER FROM UTRAN COMMAND indicating the traffic channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. After the UE receives the command it shall configure itself accordingly and switch to the new channel of the GSM cell. The SS checks whether the handover is performed by checking that the UE transmits the HANDOVER COMPLETE message to the SS in GSM cell.

Depending on the PIXIT parameters the above procedure is executed maximum three times, each time with different target channel in the GSM cell.

#### Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, depending on the PIXIT parameters.

If the UE supports enhanced circuit switched full rate traffic channel for 28.8 kbps user data:

**HANDOVER COMMAND**

Same as the HANDOVER COMMAND for M = 2 in clause 26.6.5.1 of GSM 51.010, except that the CHANNEL MODE IE is included with value = data, 29.0 kbit/s radio interface rate (28.8 kbit/s user data (E-TCH/F28.8))

If the UE supports HSCSD:

**HANDOVER COMMAND**

Same as the HANDOVER COMMAND in clause 26.13.3.1 of GSM 51.010, except that the Description of a multi-slot configuration supporting 28.8 kbps user data.

For execution 3:

#### HANDOVER FROM UTRAN COMMAND-GSM

#### HANDOVER COMMAND

Same as the HANDOVER COMMAND in clause 26.13.3.1 of GSM 51.010, except that the Description of a multi-slot configuration supporting 57.6 kbps user data.

#### 8.3.7.2.5 ——— Test requirement

After step 12 the ongoing call shall be continued on the GSM cell.

#### 8.3.7.3 ——— Inter system handover from UTRAN/To GSM/Data/Data rate down grading/Success

##### 8.3.7.3.1 ——— Definition

##### 8.3.7.3.2 ——— Conformance requirement

When the UE receives an HANDOVER FROM UTRAN COMMAND message from UTRAN the UE shall take the following actions:

- Establish the connection to the other radio access system, by using the contents of the IE "Inter system message". This IE contains candidate/ target cell identifier(s) and radio parameters relevant for the other radio access system.
- For each IE "Remaining radio access bearer", associate the radio access bearer given by the IE "RAB info" to the radio resources in the target system given by the IE "Inter system message". Other information for making the association may be included in the IE "Inter system message" and requirements may be stated in the specifications relevant for the target system [FFS].
- Switch the current connection to the other radio access system.

NOTE 1: Requirements concerning the establishment of the radio connection towards the other radio access system and the signalling procedure are outside the scope of the present document.

NOTE 2: The release of the UMTS radio resources is initiated by the other system.

NOTE 3: Currently only one radio access bearer can be associated with the IE "Inter-system message", and this association is limited to the radio access bearers in the CS domain. It is assumed that all the radio access bearers in the PS domain, if any, remain after the handover.

#### Reference(s)

TS 25.331 Clause 8.3.7.3.

#### 8.3.7.3.3 ————— Test purpose

To test that the UE handovers to the indicated channel of lower data rate in the GSM target cell when it is in the data call active state in the UTRAN serving cell and receives an HANDOVER FROM UTRAN COMMAND.

#### 8.3.7.3.4 ————— Method of test

#### Initial conditions

System Simulator : 2 cells – Cell 1 is UTRAN, Cell 2 is GSM. GSM 51.010 clause 26.6.5.1 or clause 26.13.1.3 (for HSCSD) shall be referenced for the default parameters of cell 2.

UE: CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

- UE supports both GSM and UTRAN Radio Access Technologies;
- UE supports UTRAN Streaming/unknown/uplink:28.8 DL:28.8 kbps/CS RAB + uplink:3.4 DL:3.4 kbps SRBs;
- UE supports UTRAN Streaming/unknown/uplink:57.6 DL:57.6 kbps/CS RAB + uplink:3.4 DL:3.4 kbps SRBs;
- UE supports GSM 14.4 kbps data (HSCSD or full rate traffic channel for 14.4 kbit/s user data (TCH/F14.4));
- UE supports GSM 28.8 kbps data (HSCSD or enhanced circuit switched full rate traffic channel for 28.8 kbit/s user data (E-TCH/F28.8));
- UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 2.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into data call active state (CC state U10) with a suitable configuration (e.g. Streaming/unknown/uplink:28.8 DL:28.8 kbps/CS RAB + uplink:3.4 DL:3.4 kbps SRBs for  $M = 1$ ). The SS starts GSM cell and configures a traffic channel (e.g. 14.4 kbps data channel for  $M = 1$ ), then sends HANDOVER FROM UTRAN COMMAND indicating the traffic channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. After the UE receives the command it shall configure itself accordingly and switch to the new channel of the GSM cell. The SS checks whether the handover is performed by checking that the UE transmits the HANDOVER COMPLETE message to the SS in GSM cell.

Depending on the PIXIT parameters the above procedure is executed maximum three times, each time with different target channel in the GSM cell.

### Expected sequence

This sequence is performed for a maximum execution counter  $M = 1, 2, 3$ , depending on the PIXIT parameters.

#### 8.3.7.3.5 Test requirement

After step 12 the ongoing call shall be continued on the GSM cell.

### 8.3.7.4 Inter system handover from UTRAN/To GSM/Speech/Establishment/Success

#### 8.3.7.4.1 Definition

#### 8.3.7.4.2 Conformance requirement

When the UE receives an HANDOVER FROM UTRAN COMMAND message from UTRAN the UE shall take the following actions:

- Establish the connection to the other radio access system, by using the contents of the IE "Inter system message". This IE contains candidate/ target cell identifier(s) and radio parameters relevant for the other radio access system.
- For each IE "Remaining radio access bearer", associate the radio access bearer given by the IE "RAB info" to the radio resources in the target system given by the IE "Inter system message". Other information for making the association may be included in the IE "Inter system message" and requirements may be stated in the specifications relevant for the target system [FFS].
- Switch the current connection to the other radio access system.

NOTE 1: Requirements concerning the establishment of the radio connection towards the other radio access system and the signalling procedure are outside the scope of the present document.

NOTE 2: The release of the UMTS radio resources is initiated by the other system.

NOTE 3: Currently only one radio access bearer can be associated with the IE "Inter system message", and this association is limited to the radio access bearers in the CS domain. It is assumed that all the radio access bearers in the PS domain, if any, remain after the handover.

### Reference(s)

TS 25.331 Clause 8.3.7.3.

#### 8.3.7.4.3 — Test purpose

To test that the UE handovers to the indicated channel in the GSM target cell when it is in the call establishment phase in the UTRAN serving cell and receives an HANDOVER FROM UTRAN COMMAND.

#### 8.3.7.4.4 — Method of test

#### Initial conditions

System Simulator : 2 cells – Cell 1 is UTRAN, Cell 2 is GSM. GSM 51.010 clause 26.6.5.1 shall be referenced for the default parameters of cell 2.

UE : CC State U1 in cell 1

#### Related ICS/IXIT statement(s)

- UE supports both GSM and UTRAN Radio Access Technologies,
- UE supports UTRAN AMR,
- UE supports GSM FR,
- UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U1 on cell 2.

#### Test Procedure

The SS starts the UTRAN cell and the UE is triggered to initialise an MO speech call. During the call establishment phase, after the SS receives SETUP message the SS starts GSM cell and configures a dedicated channel, then sends the UE an HANDOVER FROM UTRAN COMMAND indicating the dedicated channel in the target GSM cell. After the UE receives the command it shall configure itself accordingly and switch to the new channel of the GSM cell. The SS checks whether the handover is performed by checking that the UE transmits the HANDOVER COMPLETE message to the SS in GSM cell.

## HANDOVER COMMAND

Same as the HANDOVER COMMAND for M = 4 in clause 26.6.5.2 of GSM 51.010 version 8.2.0 Release 1999

## 8.3.7.4.5 ——— Test requirement

At step 13 the SS shall receive HANDOVER COMPLETE message on the dedicated channel of the GSM cell.

### ~~8.3.7.5 Inter system handover from UTRAN/To GSM/Speech/Failure~~

#### ~~8.3.7.5.1 Definition~~

#### ~~8.3.7.5.2 Conformance requirement~~

~~If the UE does not succeed to establish the connection to the other radio access technology, it shall~~

- ~~— resume the connection to UTRAN using the resources used before receiving the HANDOVER FROM UTRAN COMMAND message; and~~
- ~~— transmit the INTER-SYSTEM HANDOVER FAILURE message on uplink DCCH using AM RLC. When the successful delivery of the INTER-SYSTEM FAILURE message has been confirmed by RLC, the procedure ends.~~

#### ~~Reference(s)~~

~~TS 25.331 Clause 8.3.7.5.~~

#### ~~8.3.7.5.3 Test purpose~~

~~To test that the UE reactivates the old channel and transmits HANDOVER FROM UTRAN FAILURE message to the network on the old channel in UTRAN cell when it receives an HANDOVER FROM UTRAN COMMAND and the connection to GSM for handover can not be established.~~

#### ~~8.3.7.5.4 Method of test~~

#### ~~Initial conditions~~

~~System Simulator : 2 cells – Cell 1 is UTRAN, Cell 2 is GSM. GSM 51.010 clause 26.6.5.1 shall be referenced for the default parameters of cell 2.~~

~~UE: CC State U10 in cell 1~~

#### ~~Related ICS/IXIT statement(s)~~

- ~~— UE supports both GSM and UTRAN Radio Access Technologies,~~
- ~~— UE supports GSM-FR,~~
- ~~— UE supports UTRAN-AMR,~~
- ~~— UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.~~

#### ~~Foreseen final state of the UE~~

~~The UE is in CC state U10 on cell 1.~~

#### ~~Test Procedure~~

~~The SS starts the UTRAN cell and brings the UE into call active state (CC state U10) with AMR. The SS starts GSM cell without activating any dedicated channel in the cell, then sends HANDOVER FROM UTRAN COMMAND indicating a dedicated channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. The UE receives the command and configures itself accordingly but can not complete the handover. The SS checks that the handover is failed by checking that the UE transmits the HANDOVER FROM UTRAN FAILURE message to the SS in UTRAN cell.~~

## 8.3.7.5.5 ————— Test requirement

After step  $n+1$  the SS shall receive HANDOVER FROM UTRAN FAILURE message on the old channel of the UTRAN cell.

## 8.3.7.6 ————— Inter system handover from UTRAN/To GSM/Speech/Failure (L2 Establishment)

## 8.3.7.6.1 ————— Definition

## 8.3.7.6.2 ————— Conformance requirement

If the UE does not succeed to establish the connection to the other radio access technology, as is unable to obtain L2 establishment it shall

- resume the connection to UTRAN using the resources used before receiving the HANDOVER FROM UTRAN COMMAND message; and
- transmit the HANDOVER FROM UTRAN FAILURE message on uplink DCCH using AM RLC.

### Reference(s)

3GPP TS 25.331 clause 8.3.7

TS 04.06 Clause 5.4.1.3

TS 04.08 Clause 3.1.5

### 8.3.7.6.3 ————— Test purpose

To Test that the UE shall keep its old configuration and transmit a HANDOVER FROM UTRAN FAILURE message, which is set to “physical channel failure” in IE “Inter\_RAT HO failure cause”, when it receives a HANDOVER FROM UTRAN COMMAND and the connection to GSM for handover cannot be established due to failure in L2 establishment.

### 8.3.7.6.4 ————— Method of test

#### Initial conditions

System Simulator : 2 cells – Cell 1 is UTRAN, Cell 2 is GSM. GSM 51010-1 section 26.6.5.1 shall be referenced for the default parameters of cell 2.

UE: CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

UE supports both GSM and UTRAN Radio Access Technologies,

UE supports GSM-FR,

UE supports UTRAN-AMR,

UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 1.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into call active state (CC state U10) with AMR. SS activates a dedicated GSM traffic channel then sends HANDOVER FROM UTRAN COMMAND indicating a dedicated channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. When the UE does not succeed in establishing the connection to the target radio access technology it shall revert back to UTRA configuration establish the UTRA physical channel(s) used at the time for reception of HANDOVER FROM UTRAN COMMAND transmit the HANDOVER FROM UTRAN FAILURE.

##### 8.3.7.7.1 ~~Definition~~

##### 8.3.7.7.2 ~~Conformance requirement~~

~~If the UE does not succeed to establish the connection to the other radio access technology, as is unable to obtain L1 synchronization it shall~~

- ~~— resume the connection to UTRAN using the resources used before receiving the HANDOVER FROM UTRAN COMMAND message; and~~
- ~~— transmit the HANDOVER FROM UTRAN FAILURE message on uplink DCCH using AM RLC.~~

#### Reference(s)

TS 25.331 Clause 8.3.7.5

TS 04.06 Clause 5.4.1

##### 8.3.7.7.3 ~~Test purpose~~

~~To Test that the UE shall keep its old configuration and transmit a HANDOVER FROM UTRAN FAILURE message, which is set to “physical channel failure” in IE “Inter\_RAT HO failure cause”, when it receives a HANDOVER FROM UTRAN COMMAND and the connection to GSM for handover cannot be established due failure in L1 Synchronization.~~

##### 8.3.7.7.4 ~~Method of test~~

#### Initial conditions

System Simulator : 2 cell – Cell 1 is UTRAN, Cell 2 is GSM. GSM 51.010 version 4.4.0 section 26.6.5.1 shall be referenced for the default parameters of cell 2.

UE : CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

UE supports both GSM and UTRAN Radio Access Technologies,

UE supports GSM FR,

UE supports UTRAN AMR,

UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 1.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into call active state (CC state U10). The SS starts GSM cell activating dedicated channel in the cell, then sends HANDOVER FROM UTRAN COMMAND indicating a dedicated channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. The power level of target GSM cell is kept at very low level. The UE receives the command and configures itself accordingly but cannot complete the

handover. The SS checks that the handover is failed by checking that the UE transmits the HANDOVER FROM UTRAN FAILURE message to the SS in UTRAN cell.

#### 8.3.7.7.5 ————— Test requirement

The SS shall receive HANDOVER FROM UTRAN FAILURE message on the old channel of the UTRAN cell.

### ~~8.3.7.8 Inter system handover from UTRAN/To GSM/Speech/Failure (Invalid Inter-RAT message)~~

#### ~~8.3.7.8.1 Definition~~

#### ~~8.3.7.8.2 Conformance requirement~~

~~If the UE does not succeed to establish the connection to the other radio access technology, as the Inter-RAT message received is invalid, it shall~~

- ~~— resume the connection to UTRAN using the resources used before receiving the INTER-SYSTEM HANDOVER COMMAND message; and~~
- ~~— transmit the INTER-SYSTEM HANDOVER FAILURE message on uplink DCCH using AM RLC. When the successful delivery of the INTER-SYSTEM FAILURE message has been confirmed by RLC, the procedure ends.~~

#### Reference

3GPP TS 25.331 clause 8.3.7.6

#### ~~8.3.7.8.3 Test purpose~~

~~To Test that the UE shall keep its old configuration and transmit a HANDOVER FROM UTRAN FAILURE message, which is set to "Inter-RAT protocol error" in IE "Inter\_RAT HO failure cause", when it receives a Handover From UTRAN message, with the IE "Inter-RAT message" received within the HANDOVER FROM UTRAN COMMAND message not including a valid inter-RAT handover message in accordance with the protocol specifications for the target RAT.~~

#### ~~8.3.7.8.4 Method of test~~

#### Initial conditions

System Simulator : 1 UTRAN cell.

UE : CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

UE supports both GSM and UTRAN Radio Access Technologies,

UE supports GSM-FR,

UE supports UTRAN-AMR,

UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 1.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into call active state (CC state U10) with AMR. The SS then sends an HANDOVER FROM UTRAN COMMAND message not including a valid inter RAT handover message in accordance with the protocol specifications for the target RAT, to the UE through DCCH of the serving UTRAN cell. The UE receives the command and finds that the Inter Rat message is Invalid. The SS checks that the handover is failed by checking that the UE transmits the INTER-SYSTEM HANDOVER FAILURE message to the SS in UTRAN cell.

| →Inter-RAT handover failure cause | Not checked                                                                                                                                                                                                                                        |
| Inter-system message              |                                                                                                                                                                                                                                                    |

#### 8.3.7.8.5 ~~Test requirement~~

~~In step 3 the SS shall receive INTER-SYSTEM HANDOVER FAILURE message on the old channel of the UTRAN cell.~~

#### 8.3.7.9 ~~Inter system handover from UTRAN/To GSM/Speech/Failure (Unsupported configuration)~~

##### 8.3.7.9.1 ~~Definition~~

##### 8.3.7.9.2 ~~Conformance requirement:~~

~~If the UE does not succeed to establish the connection to the other radio access technology, as the configuration specified in the Inter-RAT message is not supported, it shall~~

- ~~— resume the connection to UTRAN using the resources used before receiving the INTER-SYSTEM HANDOVER COMMAND message; and~~
- ~~— transmit the INTER-SYSTEM HANDOVER FAILURE message on uplink DCCH using AM RLC. When the successful delivery of the INTER-SYSTEM FAILURE message has been confirmed by RLC, the procedure ends.~~

#### Reference

3GPP TS 25.331 clause 8.3.7.8

##### 8.3.7.9.3 ~~Test purpose~~

~~To Test that the UE shall keep its old configuration and transmit a HANDOVER FROM UTRAN FAILURE message, which is set to “configuration unsupported” in IE “Inter\_RAT HO failure cause”, when it receives a Handover From UTRAN message, with the IE "Inter-RAT message" received within the HANDOVER FROM UTRAN COMMAND message including a Configuration not Supported by the UE.~~

##### 8.3.7.9.4 ~~Method of test~~

#### ~~Initial conditions~~

~~System Simulator : 1 UTRAN cell.~~

~~UE : CC State U10 in cell 1~~

#### Related ICS/IXIT statement(s)

UE supports both GSM and UTRAN Radio Access Technologies,

UE supports GSM-FR,

UE supports UTRAN-AMR,

UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 1.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into call active state (CC state U10) with AMR. The SS then sends an HANDOVER FROM UTRAN COMMAND message including a Configuration not Supported by the UE in inter RAT handover message, to the UE through DCCH of the serving UTRAN cell. The UE receives the command and

finds that the configuration given in Inter-Rat message is not supported. The SS checks that the handover is failed by checking that the UE transmits the INTER-SYSTEM HANDOVER FAILURE message to the SS in UTRAN cell.

#### Expected sequence

| Step | Direction |    | Message                       | Comments                                                                          |
|------|-----------|----|-------------------------------|-----------------------------------------------------------------------------------|
|      | UE        | SS |                               |                                                                                   |
| 1    | UE        |    |                               | The SS brings the UE into UTRAN U10 state in cell 1                               |
| 2    | ←         |    | HandoverFromUTRAN Command-GSM | Send on cell 1 (UTRAN cell) and the message carries an unsupported configuration. |
| 3    | →         |    | InterSystemHandoverFailure    | The SS receives the message on the old channel of UTRAN cell.                     |

#### 8.3.7.9.5 ——— Test requirement

In step 3 the SS shall receive INTER-SYSTEM HANDOVER FAILURE message on the old channel of the UTRAN cell.

#### 8.3.7.10 ——— Inter system handover from UTRAN/To GSM/Speech/Failure (Reception by UE in CELL\_FACH)

##### 8.3.7.10.1 ——— Definition

##### 8.3.7.10.2 ——— Conformance requirement

If the UE does not succeed to establish the connection to the other radio access technology, as the Message received is not compatible with receiver state, it shall

- resume the connection to UTRAN using the resources used before receiving the INTER-SYSTEM HANDOVER COMMAND message; and
- transmit the INTER-SYSTEM HANDOVER FAILURE message on uplink DCCH using AM RLC. When the successful delivery of the INTER-SYSTEM FAILURE message has been confirmed by RLC, the procedure ends.

#### Reference

3GPP TS 25.331 clause 8.3.7.8a

##### 8.3.7.10.3 ——— Test purpose

The UE shall keep its old configuration when the UE receives a HANDOVER FROM UTRAN COMMAND message when in CELL\_FACH state and then transmit a HANDOVER FROM UTRAN COMMAND FAILURE message on the DCCH using AM RLC, which sets value “protocol-error” in IE “Inter\_RAT HO failure-cause” and is set to “Message not compatible with receiver state” in IE “Protocol error-cause”.

##### 8.3.7.10.4 ——— Method of test

#### Initial conditions

System Simulator : 1 UTRAN Cell

UE : RRC State CS-DCCH\_FACH (state 6-6) as specified in clause 7.4 of TS 34.108, on Cell 1

#### Related ICS/IXIT statement(s)

UE supports both GSM and UTRAN Radio Access Technologies,

UE supports GSM-FR,

UE supports UTRAN-AMR,

UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in RRC is in State CS-DCCH\_FACH (state 6-6) as specified in clause 7.4 of TS 34.108, on cell 1.

## Test Procedure

The SS starts the UTRAN cell and brings the UE into RRC Cell\_FACH\_DTCH. It then Transmits Radio Bearer reconfiguration PDU to move UE to Cell\_FACH state. The SS starts GSM cell without activating any dedicated channel in the cell, then sends INTER-SYSTEM HANDOVER COMMAND indicating a dedicated channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. The UE receives the command and configures itself accordingly but cannot complete the handover. The SS checks that the handover is failed by checking that the UE transmits the INTER-SYSTEM HANDOVER FAILURE message to the SS in UTRAN cell.

## Expected sequence

| Step | Direction |    | Message                        | Comments                                                                          |
|------|-----------|----|--------------------------------|-----------------------------------------------------------------------------------|
|      | UE        | SS |                                |                                                                                   |
| 1    |           | UE |                                | The SS brings the UE into CS-DCCH_FACH (state 6-6) _FACH state in cell 1          |
| 2    |           | ←  | InterSystemHandoverCommand-GSM | Send on cell 1 (UTRAN cell) and the message indicates: The target channel for GSM |
| 3    |           | →  | InterSystemHandoverFailure     | The SS receives the message on the old channel of UTRAN cell.                     |

## Specific message contents

Same as the message contents of clause 8.3.7.1 for M = 3.

## HANDOVER FROM UTRAN FAILURE

| Information Element                 | Value/remark                                                                                                                                                                                                                                       |

### 8.3.7.10.5 ————— Test requirement

After step 2 the SS shall receive INTER-SYSTEM HANDOVER FAILURE message on the old channel of the UTRAN cell.

### 8.3.7.11 ————— Inter system handover from UTRAN/To GSM/Speech/Failure (Invalid message reception)

#### 8.3.7.11.1 ————— Definition

#### 8.3.7.11.2 ————— Conformance requirement:

If the UE does not succeed to establish the connection to the other radio access technology, as the Handover Message received is short to decode into a valid message, it shall

- resume the connection to UTRAN using the resources used before receiving the INTER-SYSTEM HANDOVER COMMAND message; and
- transmit the INTER-SYSTEM HANDOVER FAILURE message on uplink DCCH using AM RLC. When the successful delivery of the INTER-SYSTEM FAILURE message has been confirmed by RLC, the procedure ends.

## Reference

3GPP TS 25.331 clause 8.3.7

### 8.3.7.11.3 Test purpose

The UE shall keep its old configuration when the UE receives a Handover From UTRAN message, which will be short to decode into a valid Handover From UTRAN message. It shall then transmit an RRC STATUS message on the uplink DCCH. The IE "Protocol error information" shall contain an IE "Protocol error cause" set to "ASN.1 violation or encoding error";

### 8.3.7.11.4 Method of test

#### Initial conditions

System Simulator : 1 UTRAN cell.

UE : CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

UE supports both GSM and UTRAN Radio Access Technologies,

UE supports GSM-FR,

UE supports UTRAN-AMR,

UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 1.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into call active state (CC state U10) with AMR. The SS then sends an HANDOVER FROM UTRAN COMMAND message, which will be short to decode into a valid Handover From UTRAN message, to the UE through DCCH of the serving UTRAN cell. The SS checks that the handover is failed by checking that the UE transmits an RRC STATUS message on the uplink DCCH. The IE "Protocol error information" shall contain an IE "Protocol error cause" set to "ASN.1 violation or encoding error";

#### Expected sequence

| Step | Direction |    | Message                       | Comments                                                                                                              |
|------|-----------|----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                               |                                                                                                                       |
| 1    | UE        |    |                               | The SS brings the UE into UTRAN U10 state in cell 1                                                                   |
| 2    |           | ←  | HandoverFromUTRAN Command-GSM | Send on cell 1 (UTRAN cell) and the message is short in length to be decoded into a valid Handover From UTRAN command |
| 3    |           | →  | RRCStatus                     | The SS receives the message on the old channel of UTRAN cell.                                                         |

### Specific message contents

#### HANDOVER FROM UTRAN COMMAND-GSM

A Short Message that shall not result in a valid Handover From UTRAN Command shall be sent.

#### RRC STATUS (Step 3)

| Information Element        | Value/remark                                                 |
|----------------------------|--------------------------------------------------------------|
| Protocol error information | Checked to see if set to "ASN.1 Violation or Encoding error" |

#### 8.3.7.11.5 ~~Test requirement~~

In step 3 the SS shall receive RRC Status message in the UTRAN cell.

#### 8.3.7.12 ~~Inter system handover from UTRAN/To GSM/Speech/Failure (Physical channel Failure and Reversion Failure)~~

##### 8.3.7.12.1 ~~Definition~~

##### 8.3.7.12.2 ~~Conformance requirement:~~

If the UE does not succeed to establish the connection to the other radio access technology and fail to resume the connection to UTRAN using the resources used before receiving the INTER-SYSTEM HANDOVER COMMAND message, it shall

- ~~perform a cell update procedure; and~~
- ~~transmit the INTER-SYSTEM HANDOVER FAILURE message on uplink DCCH using AM RLC. When the successful delivery of the INTER-SYSTEM FAILURE message has been confirmed by RLC, the procedure ends.~~

#### Reference

3GPP TS 25.331 clause 8.3.7.5

##### 8.3.7.12.3 ~~Test purpose~~

The UE shall perform a cell update when the UE fails to revert to the old configuration after the detection of physical channel failure in the target RAT cell as given in HANDOVER FROM UTRAN procedure. After the UE completes cell update procedure, the UE transmit HANDOVER FROM UTRAN FAILURE message on the DCCH using AM RLC, which is set IE "failure-cause" to "physical channel failure".

##### 8.3.7.12.4 ~~Method of test~~

#### Initial conditions

System Simulator : 2 cells – Cell 1 is UTRAN, Cell 2 is GSM. GSM 11.10-1 section 26.6.5.1 shall be referenced for the default parameters of cell 2.

UE : CC State U10 in cell 1

#### Related ICS/IXIT statement(s)

UE supports both GSM and UTRAN Radio Access Technologies,

UE supports GSM-FR,

UE supports UTRAN-AMR,

UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.

#### Foreseen final state of the UE

The UE is in CC state U10 on cell 1.

#### Test Procedure

The SS starts the UTRAN cell and brings the UE into call active state (CC state U10) with AMR. The SS starts GSM cell without activating any dedicated channel in the cell, then sends INTER-SYSTEM HANDOVER COMMAND indicating a dedicated channel of the target GSM cell to the UE through DCCH of the serving UTRAN cell. The UE receives the command and configures itself accordingly but cannot complete the handover and wants to revert to the old configuration, but the UE cannot revert to the old configuration because the SS shall not use the old configuration. The UE transmit CELL UPDATE message on uplink CCCH with IE "Cell update cause" set to "radio link failure". The SS shall transmit CELL UPDATE CONFIRM message on downlink CCCH after receiving CELL UPDATE message. The UE transmits PHYSICAL CHANNEL RECONFIGURATION COMPLETE message on the uplink DCCH using AM RLC and subsequently transmits the INTER-SYSTEM HANDOVER FAILURE message to the SS in UTRAN cell, on the DCCH using AM RLC, setting the value of IE "failure cause" to "physical channel failure".

#### Expected sequence

| Inter-system message                | Not Checked                                                                                                                                                                                                                                        |

#### 8.3.7.12.5 ————— Test requirement

In step 3 the SS shall receive RRC-Status message in the UTRAN cell.

### ~~8.3.7.13 Inter system handover from UTRAN/To GSM/ success / call under establishment~~

#### ~~8.3.7.13.1 Definition~~

#### ~~8.3.7.13.2 Conformance requirement:~~

~~When the UE receives an HANDOVER FROM UTRAN COMMAND message from UTRAN the UE shall take the following actions:~~

- ~~— Establish the connection to the other radio access system, by using the contents of the IE "Inter system message". This IE contains candidate/ target cell identifier(s) and radio parameters relevant for the other radio access system.~~
- ~~— For each IE "Remaining radio access bearer", associate the radio access bearer given by the IE "RAB info" to the radio resources in the target system given by the IE "Inter system message". Other information for making the association may be included in the IE "Inter system message" and requirements may be stated in the specifications relevant for the target system [FFS].~~
- ~~— Switch the current call under establishment to the other radio access system.~~

#### ~~Reference~~

~~3GPP TS 25.331 clause 8.3.7.3~~

#### ~~Test purpose~~

~~To test that the UE supporting both GSM and UTRAN handovers from a UTRAN serving cell to the indicated channel of GSM target cell when the UE is in call establishment phase and receives an HANDOVER FROM UTRAN COMMAND.~~

~~To Test that the UE continues the call in GSM cell, after Succesful completion of the Handover.~~

#### ~~8.3.7.13.4 Method of test~~

##### ~~Initial conditions~~

~~System Simulator : 1 UTRAN cell.~~

~~UE : CC State U10 in cell 1.~~

##### ~~Related ICS/IXIT statement(s)~~

~~UE supports both GSM and UTRAN Radio Access Technologies,~~

~~UE supports GSM-FR,~~

~~UE supports UTRAN-AMR,~~

~~UE supports GSM-P, GSM-E, GSM-DCS, GSM-450, GSM-480.~~

##### ~~Foreseen final state of the UE~~

~~The UE is in CC state U10 on cell 1.~~

#### ~~Test Procedure~~

~~The SS activates the UTRAN cell and GSM Cell. The UE is triggered to initialise an MO speech call. During the call establishment phase, the SS is configured to not transmit the RLC Acknowledgment for SETUP message. SS configures a dedicated channel in GSM Cell, then sends the UE an HANDOVER FROM UTRAN COMMAND indicating the~~

dedicated channel in the target GSM cell. After the UE receives the command it shall configure itself accordingly and switch to the new channel of the GSM cell. The SS checks whether the handover is performed by checking that the UE transmits the HANDOVER COMPLETE message to the SS in GSM cell. The SS checks MS correctly retransmits GC SETUP message, that was not acknowledged by UTRAN RLC Layer before the Handover, following completion of the handover to GSM cell.

#### Expected sequence

## HANDOVER COMMAND

Same as the HANDOVER COMMAND for M = 4 in clause 26.6.5.2 of GSM 11.10-1 version 8.2.0 Release 1999

### 8.3.7.13.5 Test requirement

~~At step 14 the SS shall receive SETUP message on the dedicated channel of the GSM cell, and at step 8.3.8 Inter system cell reselection to UTRAN~~

[Editor's note: This test is FFS until R2000 core specification will be defined.]

### 8.3.9 Inter system cell reselection from UTRAN

[Editor's note: This test is FFS until R2000 core specification will be defined.]

## 8.4 Measurement procedure

### 8.4.1 Measurement Control and Report

#### 8.4.1.1 Measurement Control and Report: Intra-frequency measurement for transition from idle mode to CELL\_DCH state

##### 8.4.1.1.1 Definition

##### 8.4.1.1.2 Conformance requirement

Upon a state transition from idle mode to CELL\_DCH state, the UE shall begin or continue to monitor the list of cells assigned in the IE "intra-frequency cell info list" which is specified in System Information Block type 11 or 12 messages on BCCH. When entering CELL\_DCH state, the UE shall send MEASUREMENT REPORT message(s) when the condition(s) in "intra-frequency measurement reporting criteria" IE received are fulfilled. In CELL\_DCH state, if the UE receives a MEASUREMENT CONTROL message, which contains a "measurement identity" IE similar in value to the "intra-frequency measurement identity" in System Information Block Type 11 or 12 message, it shall terminate existing monitoring activities for the neighbouring cells previously known from System Information Block type 11 or 12 messages. It shall perform the measurement and reporting tasks based on the latest MEASUREMENT CONTROL message received.

#### Reference

3GPP TS 25.331 clause 8.4.1.8.1, 8.4.1.3

##### 8.4.1.1.3 Test Purpose

To confirm that the UE continues to monitor intra-frequency measurement quantity of the cells listed in System Information Block type 11 or 12 messages, after it has entered CELL\_DCH state from idle mode. When the intra-frequency measurement reporting criteria specified in System Information Block type 11 or 12 messages have been met, it shall report the measurements using MEASUREMENT REPORT message(s). To confirm that the UE terminates monitoring and reporting activities for the cells listed in "intra-frequency cell info list" IE in System Information Block type 11 or 12 messages, after it has received a MEASUREMENT CONTROL message that specifies the measurement type to be "intra-frequency measurement" with the same measurement identity in System Information Block Type 11 or 12 messages. To confirm that the UE reconfigures the monitoring and reporting activities based on the last MEASUREMENT CONTROL message received.

#### 8.4.1.1.4 Method of test

##### Initial Condition

System Simulator: 2 cells—Cell 1 and cell 2 are active.

UE: "Registered idle mode on CS" (state 2) or "Registered idle mode on PS" (state 3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE. If the UE supports both CS and PS domains, the initial UE state shall be "Registered idle mode on CS/PS" (state 7).

##### Test Procedure

Table 8.4.1.1-1 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1" are to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

**Table 8.4.1.1-1**

| Parameter              | Unit                | Cell 1 |     |     | Cell 2 |     |     |
|------------------------|---------------------|--------|-----|-----|--------|-----|-----|
|                        |                     | T0     | T1  | T2  | T0     | T1  | T2  |
| UTRA RF Channel Number |                     | Ch. 1  |     |     | Ch. 1  |     |     |
| CPICH Ec               | dBm/<br>3.84<br>MHz | -60    | -60 | -60 | -70    | -80 | -60 |

The UE is initially at idle mode and has selected cell 1 for camping. The System Information Block type 11 messages are modified with respect to the default settings to prevent reporting of "Cell synchronisation information" and also to include cell 2 into the monitored neighbour cell list. The key measurement parameters in the modified System Information Block message are as follow: measurement type = "intra-frequency measurement", measurement quantity = "CPICH RSCP", report criteria = "periodic reporting criteria", reporting interval = "64 seconds".

SS prompts the operator to make an outgoing call of a supported traffic class. SS and UE shall execute procedure P3 (for CS service) or P5 (for PS service). Next SS and UE shall execute procedure P7 (for CS service) or P9 (for PS service). Then SS and UE shall execute procedure P11 (for CS service) or P13 (for PS service). The UE shall send a MEASUREMENT REPORT message after reaching CELL\_DCH state, reporting cell 2's CPICH RSCP value. After 64 seconds has passed since SS receives the first MEASUREMENT REPORT message, the UE shall transmit a second MEASUREMENT REPORT message.

SS sends a MEASUREMENT CONTROL message on the downlink DCCH. In this message, SS assigns an intra-frequency measurement type with the measurement quantity based on cell 2's CPICH RSCP value. Parameters used in this message are: measurement identity = "1", report criteria = "event-trigger", event identity = "1f", reporting threshold = "-70 dBm". SS checks to see that no MEASUREMENT REPORT messages are sent within the next 64 seconds (which is due to periodic reporting). SS reconfigures the downlink transmission power settings according to values in column "T1" in table 8.4.1.1-1. The UE shall transmit a MEASUREMENT REPORT message when it detects that the CPICH RSCP of cell 2 has reached the threshold value specified in MEASUREMENT CONTROL message.

SS reconfigures the downlink transmission power settings according to values in column "T2" in table 8.4.1.1-1. SS sends a new MEASUREMENT CONTROL message on the downlink DCCH. In this message, SS assigns an intra-frequency measurement type with the measurement quantity based on cell 2's CPICH RSCP value. Parameters used in this message are:

-measurement identity = "1", report criteria = "event-trigger", event identity = "1B", Reporting range 8db. SS reconfigures the downlink transmission power settings according to values in column "T0" in table 8.4.1.1-1. The UE shall transmit a MEASUREMENT REPORT message when it detects that the condition for event 1b is fulfilled.

## Expected Sequence

| Step | Direction |    | Message                                                                                      | Comment                                                                                                                                                                                                                         |
|------|-----------|----|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                                                                              |                                                                                                                                                                                                                                 |

#### MEASUREMENT REPORT (Step 14)

| Information Element            | Value/Remarks                                 |
|--------------------------------|-----------------------------------------------|
| Measurement identity           | Check to see if set to 1                      |
| Measured Results               | Check to see if this IE is absent             |
| Measured Results on RACH       | Check to see if this IE is absent             |
| Additional Measured Results    | Check to see if this IE is absent             |
| Event Results                  |                                               |
| CHOICE event result            |                                               |
| Intra-frequency event identity | Check to see if this IE is set to "1b"        |
| Cell measured event results    |                                               |
| CHOICE mode                    | Check to see if this IE is set to "FDD"       |
| Primary CPICH info             |                                               |
| Primary Scrambling Code        | Check to see if it's the same code for cell 2 |

#### 8.4.1.1.5 Test Requirement

After step 5 the UE shall start to transmit 2 MEASUREMENT REPORT messages at 64 seconds interval. The measurement quantity "CPICH RSCP" of cell 2 shall be reported in these messages.

After step 7 the UE shall not transmit any MEASUREMENT REPORT messages within 64 seconds after SS has transmitted the MEASUREMENT CONTROL message in step 7.

After step 9 the UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH, to report that the CPICH RSCP value for cell 2 has dropped below the threshold stated in the MEASUREMENT CONTROL message transmitted by the SS in step 7. This MEASUREMENT REPORT message shall also contain IE "Event results", indicating the triggering of event '1f'.

In step 12 SS transmits a new Measurement Control message. In the following the UE shall transmit a MEASUREMENT REPORT message depending on the re-adjustment of CPICH downlink transmission power in both cells containing IE "Event results", indicating the triggering of event '1b'.

#### 8.4.1.2 Measurement Control and Report: Inter-frequency measurement for transition from idle mode to CELL\_DCH state

##### 8.4.1.2.1 Definition

##### 8.4.1.2.2 Conformance requirement

After entering CELL\_DCH state from idle mode, the UE shall stop monitoring the list of cells assigned in the IE "inter-frequency cell info" IE in System Information Block 11 or 12 messages. In CELL\_DCH state, when the UE receives a MEASUREMENT CONTROL message requesting for a measurement of inter-frequency measurement type to be setup, it shall start inter-frequency measurement and the associated reporting activities if "DPCH compressed mode status info" IE in the message simultaneously activates at least one compressed mode pattern sequence. When the UE receives a MEASUREMENT CONTROL message with "Reporting cell status" IE omitted, it shall not include "Cell measured results" IE for any cells in MEASUREMENT REPORT messages sent on uplink DCCH.

#### Reference

3GPP TS 25.331 clauses 8.4.1.3, 8.4.1.8.2 and 8.6.7.9

##### 8.4.1.2.3 Test Purpose

To confirm that the UE stops monitoring the list of cells assigned in the IE "inter-frequency cell info" in System Information Block type 11 messages, after it enters CELL\_DCH state from idle mode. To confirm that the UE starts to

perform inter-frequency measurement and related reporting activities, when it receives a MEASUREMENT CONTROL message with the "DPCCH compress mode status info" IE indicating that a stored compressed mode pattern sequence be simultaneously activated. To confirm that the UE excludes the IE "cell measured results" for any cells in the MEASUREMENT REPORT messages, after it receives a MEASUREMENT CONTROL message with "Reporting cell status" IE omitted.

#### 8.4.1.2.4 Method of test

##### Initial Condition

System Simulator: 2 cells — Cell 1 and cell 4 are active..

UE: "Registered idle mode on CS" (state 2) or "Registered idle mode on PS" (state 3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE. If the UE supports both CS and PS domains, the initial UE state shall be "Registered idle mode on CS/PS" (state 7).

##### Test Procedure

Table 8.4.1.2-1 illustrates the downlink power to be applied for the 2 cells.

**Table 8.4.1.2-1**

| Parameter              | Unit                | Cell 1 | Cell 4 |
|------------------------|---------------------|--------|--------|
| UTRA RF Channel Number |                     | Ch. 1  | Ch. 2  |
| CPICH Ec               | dBm/<br>3.84<br>MHz | -60    | -75    |

The UE is initially at idle mode and has selected cell 1 for camping. The System Information Block type 11 messages are modified with respect to the default settings to prevent reporting of "Cell synchronisation information", and also to include cell 4 into "inter-frequency cells info list" IE.

SS prompts the operator to make an outgoing call for one of the traffic classes supported by the UE. SS and UE shall execute procedure P3 (for CS service) or P5 (for PS service). The RRC CONNECTION SETUP message used in procedure P3 or P5 should contain IE "DPCCH compressed mode info", activating the transmission pattern gap sequence with TGPSI=1. Next SS and UE shall execute procedure P7 (for CS service) or P9 (for PS service). Then SS and UE shall execute procedure P11 (for CS service) or P13 (for PS service). The UE shall not transmit any MEASUREMENT REPORT messages, which pertain to measurement readings for cells listed in the IE "inter-frequency cell info list" in System Information Type 11.

SS sends PHYSICAL CHANNEL RECONFIGURATION message on the downlink DCCH, specifying that compressed mode sequence pattern with TGPSI=1 be deactivated. The UE shall reply with PHYSICAL CHANNEL RECONFIGURATION COMPLETE message on the uplink DCCH. It shall stop compressed mode operations at the activation time stated in PHYSICAL CHANNEL RECONFIGURATION message. After the activation time has elapsed, SS sends MEASUREMENT CONTROL message on the downlink DCCH. In this message, SS requests UE to perform inter-frequency measurement with periodic reporting of CPICH RSCP values for cell 4. The "DPCCH compressed status info" IE in this message activates the transmission gap pattern sequence with TGPSI=1. The UE shall start inter-frequency measurement and reporting for cell 4's CPICH RSCP values. It shall report this measurement result by transmitting MEASUREMENT REPORT messages on uplink DCCH periodically at 16 seconds interval.

SS sends MEASUREMENT CONTROL message on the downlink DCCH omitting the IE "Reporting cell status". The UE shall send MEASUREMENT REPORT messages on the uplink DCCH, with the IE "Cell measured results" excluded in these messages.

## Expected Sequence

| Step | Direction |    | Message                                                                                      | Comment                                                                                                                                                                                                                     |
|------|-----------|----|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                                                                              |                                                                                                                                                                                                                             |

## 8.4.1.2.5 Test Requirement

After step 5 the UE shall not transmit any MEASUREMENT REPORT messages pertaining to the measurement of CPICH RSCP of cell 4.

After step 9 the UE shall transmit MEASUREMENT REPORT messages on uplink DCCH, reporting cell 4's CPICH RSCP value at periodic time interval of 16 seconds in "inter-frequency cell measurement results" IE.

After step 11 the UE shall transmit only 1 MEASUREMENT REPORT message on the uplink DCCH. In this message, IE "inter-frequency cell measured results" shall be absent.

## 8.4.1.3 Measurement Control and Report: Intra-frequency measurement for transition from idle mode to CELL\_FACH state

## 8.4.1.3.1 Definition

## 8.4.1.3.2 Conformance requirement

The UE shall begin monitoring cells listed in the IE "intra-frequency cell info list" received in System Information Block type 11 or 12 messages, upon a transition from idle mode to CELL\_FACH state. If IE "intra-frequency measurement reporting criteria" is specified in System Information Block Type 11 or 12 messages, the UE shall store this information and shall apply these reporting rules in a subsequent transition to CELL\_DCH state. If the UE receives IE "Intra-frequency reporting for RACH reporting" and IE "Maximum number of Reported cells on RACH" in System Information Block type 11 or 12 messages, the UE shall use these measurement information and report the measured results when sending messages on RACH.

## Reference

3GPP TS 25.331, clause 8.4.1.9.1, 8.4.1.7.1

8.4.1.3.3 Test Purpose

To confirm that the UE begins or continues to monitor cells listed in IE "intra-frequency cell info list" of System Information Block type 11 or 12 messages after it has entered CELL\_FACH state from idle mode. To confirm that the UE applies the reporting criteria stated in "intra-frequency measurement reporting criteria" IE in System Information Block Type 11 or 12 in a subsequent transition to CELL\_DCH state. To confirm that the UE reports measured results on RACH messages, if it receives IE "Intra-frequency reporting quantity for RACH reporting" and IE "Maximum number of reported cells on RACH" from System Information Block Type 11 or 12 upon a transition from idle mode to CELL\_FACH state.

8.4.1.3.4 Method of test

Initial Condition

System Simulator: 2 cells. Cell 1 and cell 2 are active.

UE: "Registered idle mode on PS" (state 3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE. If the UE supports both CS and PS domains, the initial UE state shall be "Registered idle mode on CS/PS" (state 7).

Test Procedure

Table 8.4.1.3-1 illustrates the downlink power to be applied for the 2 cells in this test case.

Table 8.4.1.3-1

| Parameter              | Unit                | Cell 1 | Cell 2 |
|------------------------|---------------------|--------|--------|
| UTRA RF Channel Number |                     | Ch. 1  | Ch. 1  |
| CPICH Ec               | dBm/<br>3.84<br>MHz | -60    | -70    |

The UE is initially at idle mode and has selected cell 1 for camping. The System Information Block type 11 messages are modified with respect to the default settings to prevent reporting of "Cell synchronisation information" and also to include cell 2 into the IE "intra-frequency cell info list". The key measurement parameters are as follow: measurement type = "intra-frequency measurement", measurement quantity = "CPICH RSCP", report criteria = "periodic reporting criteria", reporting interval = "12 seconds". In the System Information type 11 messages, reporting of CPICH RSCP is also required for intra-frequency reporting when transmitting RACH messages on cell 1.

SS prompts the operator to make an outgoing call for one of the traffic classes supported by the UE. SS and UE shall execute procedure P6. Next SS and UE shall execute procedure P10. Then SS and UE shall execute procedure P14. SS starts timer T305 and waits until timer T305 expires, the UE shall send a CELL\_UPDATE message on the CCCH which includes the measurement reading of cell 1's CPICH RSCP values in IE "Measured results on RACH". SS then replies with CELL\_UPDATE\_CONFIRM message on the downlink DCCH, without changing the physical channel resources.

SS transmits PHYSICAL\_CHANNEL\_RECONFIGURATION message, and allocates dedicated physical channels to the UE. The UE shall transit to CELL\_DCH state and then send a MEASUREMENT\_REPORT message, correctly stating the measurement identity. The measurement identity indicated shall match the value that was previously broadcasted on System Information Block type 11 messages when the UE was still in idle mode. The IE "Measured results" in the MEASUREMENT\_REPORT messages shall contain measured values of cell 2's CPICH RSCP.

## Expected Sequence

| Step | Direction |    | Message                                                              | Comment                                                                                                                                                                         |
|------|-----------|----|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                                                      |                                                                                                                                                                                 |

#### CELL UPDATE (Step 7)

| Information Element                     | Value/Remarks                                                                       |
|-----------------------------------------|-------------------------------------------------------------------------------------|
| U-RNTI                                  | Check to see if set to same U-RNTI value assigned in the execution of procedure P6. |
| Cell update cause                       | Check to see if set to 'Periodic cell updating'                                     |
| Protocol error indicator                | Check to see if set to 'FALSE'                                                      |
| Measured results on RACH                |                                                                                     |
| Measurement result for current cell     |                                                                                     |
| CHOICE measurement quantity             | Check to see if set to 'CPICH RSCP'                                                 |
| CPICH RSCP                              | Checked to see if set to within an acceptable range.                                |
| Measurement results for monitored cells | Checked to see if this IE is absent.                                                |
| Protocol error information              | Check to see if set to 'FALSE'                                                      |

#### PHYSICAL CHANNEL RECONFIGURATION (Step 9)

Use the same message sub-type found in Annex A, which is entitled "Packet to CELL\_DCH from CELL\_FACH".

## MEASUREMENT REPORT (Step 11)

| Information Element                    | Value/Remarks                                                      |
|----------------------------------------|--------------------------------------------------------------------|
| Measurement identity                   | Check to see if set to 5                                           |
| Measured Results                       |                                                                    |
| —— CHOICE measurement                  | Check to see if set to "Intra-frequency measured results list"     |
| —— Intra-frequency measurement results |                                                                    |
| —— Cell measured results               |                                                                    |
| —— Cell Identity                       | Check to see if it is absent                                       |
| —— SFN-SFN observed time difference    | Check to see if this IE is absent                                  |
| —— Cell synchronisation information    | Check to see if this IE is absent                                  |
| —— Primary CPICH Info                  |                                                                    |
| —— Primary Scrambling Code             | Check to see if it's the same code for cell 2                      |
| —— CPICH Ec/No                         | Check to see if this IE is absent                                  |
| —— CPICH RSCP                          | Check to see if this IE is present                                 |
| —— Pathloss                            | Check to see if this IE is absent                                  |
| Measured Results on RACH               | Check to see if this IE is absent                                  |
| Event Results                          |                                                                    |
| —— CHOICE event result                 | Check to see if set to "Intra-frequency measurement event results" |
| —— Intra-frequency event identity      | Check to see if set to "1a"                                        |
| —— Cell measurement event results      |                                                                    |
| —— CHOICE Mode                         | Check to see if set to "FDD"                                       |
| —— Primary CPICH info                  |                                                                    |
| —— Primary Scrambling Code             | Check to see if set to the scrambling code of cell 2               |

## 8.4.1.3.5 Test Requirement

After step 5 the UE shall not transmit any MEASUREMENT REPORT messages on the uplink DCCH.

After step 6 the UE shall initiate cell update procedure by transmitting CELL UPDATE message on CCCH. In this message, IE "cell update cause" shall be set to "periodic cell updating". It shall include IE "measured results on RACH", containing the measurement value for cell 1's CPICH RSCP.

After step 10 the UE shall transmit MEASUREMENT REPORT messages at 16 seconds interval. In these messages, cell 2's CPICH RSCP value shall be reported in IE "Measured results". The IE "measurement identity" in this message shall match the IE "Intra-frequency measurement identity" found in System Information Block type 11 messages transmitted in step 1. The MEASUREMENT REPORT messages shall also contain IE "Event results", indicating that intra-frequency event "1a" has triggered in the UE.

## 8.4.1.4 Measurement Control and Report: Inter-frequency measurement for transition from idle mode to CELL\_FACH state

## 8.4.1.4.1 Definition

## 8.4.1.4.2 Conformance requirement

After entering CELL\_FACH state from idle mode, the UE shall start to monitor the cells listed in IE "inter-frequency cell info list" assigned in the System Information Block type 11 or 12 messages.

## Reference

3GPP TS 25.331, clause 8.4.1.9.2

## 8.4.1.4.3 Test Purpose

To confirm that the UE begins to monitor the list of cells assigned in the IE "inter-frequency cell info list" in System Information Block type 11 or 12 messages, after it enters CELL\_FACH state from idle mode. However, it shall not transmit any MEASUREMENT REPORT messages to report measured results for inter-frequency cells.

#### 8.4.1.4.4 Method of test

##### Initial Condition

System Simulator: 2 cells—Cell 1 and cell 4 are active.

UE: "Registered idle mode on PS" (state 3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE. If the UE supports both CS and PS domains, the initial UE state shall be "Registered idle mode on CS/PS" (state 7).

##### Test Procedure

Table 8.4.1.4-1 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions, while columns marked "T1" are to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

**Table 8.4.1.4-1**

| Parameter              | Unit                | Cell 1 |     | Cell 4 |     |
|------------------------|---------------------|--------|-----|--------|-----|
|                        |                     | T0     | T1  | T0     | T1  |
| UTRA RF Channel Number |                     | Ch. 1  |     | Ch. 2  |     |
| CPICH Ec               | dBm/<br>3.84<br>MHz | -60    | -75 | -75    | -60 |

The UE is initially at idle mode and has selected cell 1 for camping. The System Information Block type 11 messages are modified with respect to the default settings to prevent reporting of "Cell synchronisation information" and also to include cell 4 into the "inter-frequency cell list" IE.

SS prompts the operator to make an outgoing call of a supported traffic class. SS and UE shall execute procedure P6. Next SS and UE shall execute procedure P10. Then SS and UE shall execute procedure P14. The UE shall not transmit any MEASUREMENT REPORT messages, which pertain to measurement readings for inter-frequency cells belonging to the monitored set. SS re-adjusts its downlink power settings according to columns marked "T1" in table 8.4.1.4-1. This is expected to trigger a cell reselection in the UE. The UE shall send CELL UPDATE message to cell 4 in order to report this event. Upon receiving this message, SS replies with the default CELL UPDATE CONFIRM message on the downlink DCCH.

**CELL UPDATE (Step 8)**

| Information Element        | Value/Remarks                                                                     |
|----------------------------|-----------------------------------------------------------------------------------|
| U-RNTI                     | Check to see if set to same U-RNTI assigned during the execution of procedure P6. |
| Cell update cause          | Check to see if it is set to "Cell Reselection"                                   |
| Protocol error info        | Check to see if it is absent or set to FALSE                                      |
| Measured results on RACH   | Check to see if it is absent                                                      |
| Protocol error information | Check to see if it is absent                                                      |

**CELL UPDATE CONFIRM (Step 9)**

Use the message sub-type in default message content defined in Annex A.

**8.4.1.4.5 — Test Requirement**

After step 5 the UE shall not transmit any MEASUREMENT REPORT messages pertaining to any measurement quantities for cell 4.

After step 7 the UE shall reselect to cell 4 and transmit a CELL UPDATE message on the uplink CCCH of cell 4.

**8.4.1.5 — Measurement Control and Report: Intra-frequency measurement for transition from CELL\_DCH to CELL\_FACH state****8.4.1.5.1 — Definition****8.4.1.5.2 — Conformance requirement**

After entering CELL\_FACH state from CELL\_DCH state, the UE shall stop intra-frequency type measurement reporting assigned in a MEASUREMENT CONTROL message. After transition to CELL\_FACH state, the UE shall start to monitor cells listed in the IE "intra-frequency cell info" received in System Information Block type 11 or 12. If no intra-frequency measurements applicable to CELL\_DCH are stored in the UE, and that the UE receives "intra frequency reporting criteria" IE in System Information Block type 11 or 12 messages received whilst in CELL\_FACH state, it shall apply these reporting criteria after a subsequent return to CELL\_DCH state. If the UE receives the IE "Intra-frequency reporting quantity for RACH reporting" and the IE "Maximum number of reported cells on RACH" in System Information Block Type 11 or 12 during a transition from CELL\_DCH to CELL\_FACH, the UE shall append the measured results when transmitting uplink RACH messages.

**Reference**

3GPP TS 25.331, clause 8.4.1.6.1, 8.4.1.7.1

**8.4.1.5.3 — Test Purpose**

To confirm that the UE stops performing intra-frequency measurement reporting specified in a MEASUREMENT CONTROL message, when it moves from CELL\_DCH state to CELL\_FACH state. To confirm that the UE reads the System Information Block type 11 or 12 messages when it enters CELL\_FACH state from CELL\_DCH state, and starts to monitor the cells listed in the IE "intra-frequency cell info". To confirm that the UE performs measurements on uplink RACH transmissions and appends the measured results in RACH messages, when it receives IE "intra-frequency reporting quantity for RACH reporting" and IE "Maximum number of reported cells on RACH" in the System Information Block type 11 or 12 messages. To confirm that the UE applies the reporting criteria in IE "intra-frequency reporting criteria" in System Information Block Type 11 or 12 messages following a state transition from CELL\_FACH to CELL\_DCH, if no intra-frequency measurements applicable to CELL\_DCH are stored.

**8.4.1.5.4 — Method of test****Initial Condition**

System Simulator: 3 cells — Cell 1 and cell 2 are active, while cell 3 is switched off..

UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

Test Procedure

Table 8.4.1.5-1 illustrates the downlink power to be applied for the 3 cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions, while columns marked "T1" are to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

Table 8.4.1.5-1

| Parameter              | Unit                | Cell 1 |     | Cell 2 |     | Cell 3 |     |
|------------------------|---------------------|--------|-----|--------|-----|--------|-----|
|                        |                     | T0     | T1  | T0     | T1  | T0     | T1  |
| UTRA RF Channel Number |                     | Ch. 1  |     | Ch. 1  |     | Ch. 1  |     |
| CPICH Ec               | dBm/<br>3.84<br>MHz | -60    | -60 | -80    | -85 | -122   | -70 |

The UE is initially in CELL\_DCH state. The System Information Block type 11 message is modified with respect to the default message contents, in order to prevent the reporting of "Cell synchronisation information". No measurement requirements are specified for the UE in any of the System Information Block type 11 or 12 messages.

SS sends a MEASUREMENT CONTROL message to UE. In this message, the SS requests the establishment of an intra-frequency measurement task for the measurement of cell 2's CPICH RSCP. At the same time, reporting of cell 2's CPICH RSCP is commanded with the reporting criteria set to "periodic reporting" and "reporting interval" set to 16 seconds. The UE shall start transmitting MEASUREMENT REPORT messages at 16 seconds interval corresponding to the requested reporting event.

SS transmits PHYSICAL CHANNEL RECONFIGURATION message, and configures RACH and FACH channels in the uplink and downlink directions respectively. After receiving this message, the UE shall reconfigure itself and reply with a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message on RACH. SS acknowledges this message and the UE shall move to CELL\_FACH state. SS monitors the uplink channels to verify that no MEASUREMENT REPORT messages are received.

SS reconfigures itself according to the settings in columns marked "T1" in table 8.4.1.5-1. SS transmits System Information Block type 12 messages in cell 1, which include cell 3 into the IE "intra-frequency cell info". IEs "Intra-frequency reporting quantity for RACH Reporting" and IE "Maximum number of Reported cells on RACH" are also specified in the System Information Type 12 messages. Event type 1a reporting criterion is specified for intra-frequency measurements. SS transmit SYSTEM INFORMATION CHANGE INDICATION message to UE. SS waits until T305 has expired. The UE shall respond with a CELL UPDATE message, which comprises IE "Measured results on RACH" to report the readings of CPICH RSCP for cell 1 and cell 3. SS replies with CELL UPDATE CONFIRM message on the downlink DCCH. This message does not change the physical resources nor allocate any new RNTI identities. SS transmits PHYSICAL CHANNEL RECONFIGURATION message again, and configures dedicated physical channel for both uplink and downlink directions. The UE shall send PHYSICAL CHANNEL RECONFIGURATION COMPLETE message and return to CELL\_DCH state. SS listens to the uplink DCCH for MEASUREMENT REPORT messages. SS shall receive the MEASUREMENT REPORT messages with IE "Event results" at 8 seconds interval.

#### Expected Sequence

| Step | Direction |    | Message                                                      | Comment                                                                                                                                                                                                                                                                            |

#### SYSTEM INFORMATION CHANGE INDICATION (Step 10)

| Information Element                     | Value/Remarks |
|-----------------------------------------|---------------|
| BCCH modification info<br>MIB Value tag | 2             |

#### CELL UPDATE (Step 11)

| Information Element                     | Value/Remarks                                                                              |
|-----------------------------------------|--------------------------------------------------------------------------------------------|
| U-RNTI                                  | Check to see if set to the same value assigned during the execution of procedure P3 or P5. |
| Cell update cause                       | Check to see if it is set to "Periodical cell update"                                      |
| Protocol error info                     | Check to see if it is absent or set to FALSE                                               |
| Measured results on RACH                |                                                                                            |
| Measurement result for current cell     |                                                                                            |
| CHOICE measurement quantity             | Check to see if set to "CPICH RSCP"                                                        |
| CPICH RSCP                              | Check to see if it is present                                                              |
| Measurement results for monitored cells |                                                                                            |
| SFN-SFN observed time difference        | Not Checked                                                                                |
| Primary CPICH info                      |                                                                                            |
| Primary scrambling code                 | Check to see if the same as cell 3's code.                                                 |
| CHOICE measurement quantity             | Check to see if set to "CPICH RSCP"                                                        |
| CPICH RSCP                              | Check to see if it is present                                                              |
| Protocol error information              | Check to see if it is absent                                                               |

#### PHYSICAL CHANNEL RECONFIGURATION (Step 13)

Use the same message sub-type found in Annex A, which is entitled "(Packet to CELL\_DCH from CELL\_FACH in PS)".

## MEASUREMENT REPORT (Step 15)

| Information Element                 | Value/Remarks                                                           |
|-------------------------------------|-------------------------------------------------------------------------|
| Measurement identity                | Check to see if set to 6                                                |
| Measured Results                    |                                                                         |
| CHOICE measurement                  | Check to see if set to "Intra-frequency measured results list"          |
| Intra-frequency measurement results |                                                                         |
| Cell measured results               |                                                                         |
| Cell Identity                       | Check to see if it is absent                                            |
| SFN-SFN observed time difference    | Check to see if this IE is absent                                       |
| Cell synchronisation information    | Check to see if this IE is absent                                       |
| Primary CPICH Info                  |                                                                         |
| Primary Scrambling Code             | Check to see if it's the same code for cell 1                           |
| CPICH Ec/No                         | Check to see if this IE is absent                                       |
| CPICH RSCP                          | Check to see if this IE is present                                      |
| Pathloss                            | Check to see if this IE is absent                                       |
| Cell measured results               |                                                                         |
| Cell Identity                       | Check to see if it is absent                                            |
| SFN-SFN observed time difference    | Check to see if this IE is absent                                       |
| Cell synchronisation information    | Check to see if this IE is absent                                       |
| Primary CPICH Info                  |                                                                         |
| Primary Scrambling Code             | Check to see if it's the same code for cell 2                           |
| CPICH Ec/No                         | Check to see if this IE is absent                                       |
| CPICH RSCP                          | Check to see if this IE is present                                      |
| Pathloss                            | Check to see if this IE is absent                                       |
| Cell measured results               |                                                                         |

| Primary Scrambling Code             | Check to see if set to the same code for cell 3                         |

## 8.4.1.5.5 Test Requirement

After step 5, the UE shall start to transmit MEASUREMENT REPORT messages at 16 seconds interval. The message shall contain IE "measured result" to report cell 2's CPICH RSCP value.

After step 8, the UE shall not send any MEASUREMENT REPORT messages containing reporting quantities requested in MEASUREMENT CONTROL messages in step 5.

After step 10, the UE shall perform a cell update procedure and transmit a CELL UPDATE message. In this message, measured values CPICH RSCP for cell 1 and cell 3 shall be included in the IE "measured results on RACH".

After step 15, the UE shall apply the intra-frequency measurement reporting criteria" received in System Information Block type 12 messages of step 9. It shall send MEASUREMENT REPORT messages at 8 seconds interval. In these messages, triggering of event '1a' shall be reported in IE "Event results" with IE "Primary CPICH info" containing the primary scrambling code for cell 3.

### 8.4.1.6 Measurement Control and Report: Inter-frequency measurement for transition from CELL\_DCH to CELL\_FACH state

#### 8.4.1.6.1 Definition

#### 8.4.1.6.2 Conformance requirement

When transiting from CELL\_DCH state to CELL\_FACH state, the UE shall stop all measurement reporting activities related to inter-frequency measurements assigned in a MEASUREMENT CONTROL message. After a transition from CELL\_DCH state to CELL\_FACH state, the UE shall begin to monitor cells listed in the IE "inter-frequency cell info" in the System Information Block type 11 or 12 messages.

#### Reference

3GPP TS 25.331, clause 8.4.1.6.2

#### 8.4.1.6.3 Test Purpose

To confirm that UE ceases inter-frequency type measurement reporting assigned in MEASUREMENT CONTROL message when moving from CELL\_DCH state to CELL\_FACH. To confirm that the UE begins to monitor the cells listed in "inter-frequency cell info" received in System Information Block type 11 or 12 messages, following a state transition from CELL\_DCH state to CELL\_FACH state.

#### 8.4.1.6.4 Method of test

##### Initial Condition

System Simulator: 2 cells — Cell 1 and cell 2 are active.

UE: CS-DCCH+DTCH\_DCH (state 6-9) or PS-DCCH+DTCH\_DCH (state 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

##### Test Procedure

Table 8.4.1.6-1 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution. Columns marked "T0" denote the initial conditions, while columns marked "T1" are to be applied subsequently. The exact instants on which these values shall be applied are described in the texts in this clause.

**Table 8.4.1.6-1**

| Parameter              | Unit                | Cell 1 |     | Cell 4 |     |
|------------------------|---------------------|--------|-----|--------|-----|
|                        |                     | T0     | T1  | T0     | T1  |
| UTRA RF Channel Number |                     | Ch. 1  |     | Ch. 2  |     |
| CPICH-Ec               | dBm/<br>3.84<br>MHz | -60    | -75 | -75    | -60 |

The UE is initially in CELL\_DCH state. The System Information Block type 11 message is modified with respect to the default settings, so that no measurement tasks are required of the UE. SS transmits PHYSICAL CHANNEL RECONFIGURATION message. In this message, IE "DPCH compressed mode info" is present, which indicates that the UE shall apply the given parameters for compressed mode operations. The UE shall return a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message to acknowledge that compressed mode mechanism can be exercised.

SS sends a MEASUREMENT CONTROL message to the UE, including cell 4 into the IE "inter-frequency cell info". The IE "CHOICE reporting criteria" in this message is set to "periodic reporting criteria". SS waits for 8 seconds to allow the periodic timer to expire. The UE shall send a MEASUREMENT REPORT message containing IE "inter-frequency cell measurement results" to report cell 4's RSCP value. SS transmits PHYSICAL CHANNEL

RECONFIGURATION message again and reconfigures common physical channels. The UE shall return a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message and then move to CELL\_FACH state.

SS modifies the contents of Master Information Block (MIB) and System Information Block (SIB) type 11. In SIB 11, cell 4 is added to the cells listed in the "inter-frequency cell info" IE. SS transmit SYSTEM INFORMATION CHANGE INDICATION message to UE. SS waits for 8 seconds to detect any uplink MEASUREMENT REPORT messages. SS verifies that no MEASUREMENT REPORT message(s) are received as a result of inter-frequency measurements. SS then reconfigures the downlink transmission power settings of cell 1 and cell 4 according to the values stated in columns "T1" of table 8.4.1.6-1. SS waits for [x] seconds to allow the UE to perform cell re-selection. The UE shall transmit a CELL UPDATE message on the uplink CCCH of cell 4, specifying the "cell update cause" IE as "cell re-selection". SS replies with CELL UPDATE CONFIRM message on the downlink DCCH to complete the cell update procedure.

## Expected Sequence

| Step | Direction |    | Message                                                    | Comment                                                                                                                                                                                                                                  |
|------|-----------|----|------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                                            |                                                                                                                                                                                                                                          |

| —— UTRA carrier RSSI                        | Check to see if it is absent                                           |
| —— Inter-frequency cell measurement results |                                                                        |
| —— Cell measured results                    |                                                                        |
| —— Cell Identity                            | Check to see if it is absent                                           |
| —— SFN-SFN observed time difference         | Check to see if it is absent                                           |
| —— Cell synchronisation information         | Check to see if it is absent                                           |
| —— Primary CPICH Info                       |                                                                        |
| —— Primary Scrambling Code                  | Check to see if set to the same code for cell 4                        |
| —— CPICH Ec/No                              | Check to see if it is absent                                           |
| —— CPICH RSCP                               | Check to see if it is present                                          |
| —— Pathloss                                 | Check to see if it is absent                                           |
| Measured Results on RACH                    | Check to see if it is absent                                           |
| Event Results                               | Check to see if it is absent                                           |

## PHYSICAL CHANNEL RECONFIGURATION (Step 10)

Use the same message sub-type found in Annex A, which is entitled "(Packet to CELL\_FACH from CELL\_DCH in PS)".

## Master Information Block (Step 12)

| Information Element | Value/Remarks |
|---------------------|---------------|
| MIB value tag       | 2             |

## System Information Block type 11 (Step 12)

| Information Element                            | Value/Remarks                        |
|------------------------------------------------|--------------------------------------|
| Measurement control system information         |                                      |
| Use of HCS                                     | Not used                             |
| Cell selection and reselection quality measure | CPICH_Ec/No                          |
| Intra-frequency measurement system information | Not Present                          |
| Inter-frequency measurement system information |                                      |
| Inter-frequency cell info list                 |                                      |
| CHOICE Inter-frequency cell removal            | No inter-frequency cells removed     |
| New inter-frequency cells                      |                                      |
| Inter-frequency cell id                        | 4                                    |
| Frequency info                                 |                                      |
| CHOICE mode                                    | FDD                                  |
| UARFCN uplink (Nu)                             | Set to uplink UARFCN for cell 4      |
| UARFCN downlink (Nd)                           | Set to downlink UARFCN for cell 4    |
| Cell info                                      |                                      |
| Cell individual offset                         | Not Present                          |
| Reference time difference to cell              | Not Present                          |
| Read SFN indicator                             | FALSE                                |
| CHOICE Mode                                    | FDD                                  |
| Primary CPICH info                             |                                      |
| Primary scrambling code                        | Set to the scrambling code of cell 4 |
| Primary CPICH Tx power                         | Not Present                          |
| TX diversity indicator                         | FALSE                                |
| Cells for measurement                          | Not Present                          |
| Cell selection and re-selection info           | Not Present                          |
| Inter-RAT measurement system information       | Not Present                          |
| Traffic volume measurement system information  | Not Present                          |
| UE Internal measurement system information     | Not Present                          |

## SYSTEM INFORMATION CHANGE INDICATION (Step 13)

| Information Element    | Value/Remarks |
|------------------------|---------------|
| BCCH modification info |               |
| MIB Value tag          | 2             |

## CELL UPDATE (Step 15)

| Information Element        | Value/Remarks                                      |
|----------------------------|----------------------------------------------------|
| U-RNTI                     | Check to see if same to value assigned in P3 or P5 |
| Cell update cause          | Check to see if it is set to "Cell Reselection"    |
| Protocol error info        | Check to see if it is absent or set to FALSE       |
| Measured results on RACH   | Check to see if it is absent                       |
| Protocol error information | Check to see if it is absent                       |

## CELL UPDATE CONFIRM (Step 16)

Use the same message sub-type found in Annex A.

## 8.4.1.6.5 Test Requirement

After step 8 the UE shall transmit MEASUREMENT REPORT message to report cell 4's RSCP value in the IE "inter-frequency cell measured results".

After step 11 the UE shall stop sending MEASUREMENT REPORT messages, which contain inter-frequency measured results for cell 4's CPICH RSCP value.

After step 14 the UE shall transmit CELL\_UPDATE message on the uplink CCCH of cell 4, and the "cell update cause" IE shall be set to "cell reselection".

#### ~~8.4.1.7 Measurement Control and Report: Intra-frequency measurement for transition from CELL\_FACH to CELL\_DCH state~~

##### ~~8.4.1.7.1 Definition~~

##### ~~8.4.1.7.2 Conformance requirement~~

After transiting from CELL\_FACH state to CELL\_DCH state, the UE shall retrieve each set of measurement control information of measurement type "intra-frequency", if the measurement control information has "measurement validity" IE set to "CELL\_DCH". If the UE has performed a cell reselection whilst out of CELL\_DCH state and that the cell reselection has occurred after the storage of measurement control information, the UE shall delete the stored intra-frequency measurement information.

If the UE has no stored intra-frequency measurements applicable to CELL\_DCH state, it shall continue to monitor the list of cells in IE "intra-frequency cell info" stated in System Information Block type 11 or 12 messages. It shall transmit MEASUREMENT REPORT messages when the reporting criteria in IE "intra-frequency measurement reporting criteria" in System Information Block type 11 or 12 messages are fulfilled. When in CELL\_DCH state, the UE shall override existing measurement and reporting contexts obtained from System Information Block type 11 or 12 messages, if a MEASUREMENT CONTROL message is received. The UE shall start to use the new measurement and reporting parameters received in the MEASUREMENT CONTROL message.

#### Reference

3GPP TS 25.331, clause 8.4.1.7.1

##### ~~8.4.1.7.3 Test Purpose~~

To confirm that UE retrieves stored measurement control information for intra-frequency measurement measurement type with "measurement validity" assigned to "CELL\_DCH", after it enters CELL\_DCH state from CELL\_FACH state. To confirm that the UE continues to monitor the neighbouring cells listed "intra-frequency cell info" IE in the System Information Block type 11 or 12 messages, if no intra-frequency measurements applicable to CELL\_DCH are stored. To confirm that the UE transmits MEASUREMENT REPORT messages if reporting criteria stated in IE "intra-frequency measurement reporting criteria" in System Information Block type 11 or 12 messages are fulfilled. To confirm that a MEASUREMENT CONTROL message received in CELL\_DCH state overrides the measurement and associated reporting contexts maintained in the UE by virtue of System Information Block type 11 or 12 messages.

##### ~~8.4.1.7.4 Method of test~~

#### ~~Initial Condition~~

System Simulator: 3 cells—Cell 1, cell 2 and cell 3 are active.

UE: PS-DGCH+DTCH\_FACH (state 6-11).

#### Test Procedure

Table 8.4.1.7-1 illustrates the downlink power to be applied for the 3 cells at various time instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1" are to be applied subsequently. The exact instants on which these values shall be applied are described in the text in this clause.

Table 8.4.1.7-1

| Para-meter                   | Unit                | Cell-1 |      | Cell-2 |     | Cell-3 |     |

The UE is brought to CELL\_FACH state in cell 1. System Information Block type 12 message is changed with respect to the default message contents, with cell 2 included in the IE "intra-frequency cell info". Event 1e is selected in IE "Reporting information for state CELL\_DCH", and "Intra-frequency measurement quantity" is set to CPICH RSCP.

SS send a RADIO BEARER RECONFIGURATION message to UE, and configures dedicated physical channels on both uplink and downlink directions. The UE shall move to CELL\_DCH state and then return RADIO BEARER RECONFIGURATION COMPLETE message. The UE shall send MEASUREMENT REPORT messages containing IE "Measured results" to report cell 2's CPICH RSCP value and IE "event results" to report triggering of event type "1e". After receiving the MEASUREMENT REPORT messages, SS transmits a MEASUREMENT CONTROL message with only cell 3 included in the IE "intra-frequency cell info" and IE "CHOICE reporting criteria" set to "periodic reporting". After receiving such a message, the UE shall transmit another set of MEASUREMENT REPORT messages. SS verifies that only measurement readings for cell 3's CPICH RSCP are report in IE "cell measured results" in these messages.

Next, SS sends PHYSICAL CHANNEL RECONFIGURATION message. SS configures common physical channels for both the uplink and the downlink directions. The UE shall transit to CELL\_FACH state and then reply with a PHYSICAL CHANNEL RECONFIGURATION COMPLETE. SS waits for 16 seconds and checks the uplink RACH to confirm that no MEASUREMENT REPORT messages are received. SS transmits MEASUREMENT CONTROL message on the downlink DCCH. The key parameters specified in this message are: measurement command = 'setup', measurement type = 'intra-frequency measurement', measurement object = 'cell 2', reporting criteria = 'periodic reporting', measurement validity IE is present and "UE state" = "CELL\_DCH". SS waits for 16 seconds, verifies that no MEASUREMENT REPORT messages are detected on the uplink DCCH. SS sends RADIO BEARER RECONFIGURATION message and configures dedicated physical channels. The UE shall return to CELL\_DCH state, transmit a RADIO BEARER RECONFIGURATION COMPLETE message and start to monitor cell 2. The UE shall also resume periodic reporting of cell 2's CPICH RSCP measured results by sending MEASUREMENT REPORT messages. Following the reception of the MEASUREMENT REPORT message, SS commands the UE using MEASUREMENT CONTROL message to release measurement control information stored in "measurement identity" = 12. Thereafter, SS verifies that no MEASUREMENT REPORT messages are detected on the uplink DCCH. After this requirement is satisfied, SS sends MEASUREMENT CONTROL on the downlink DCCH once more. This message is identical to the one sent in step 5 (see specific message content).

SS transmits a PHYSICAL CHANNEL RECONFIGURATION message on the downlink DCCH and configures common physical channel. The UE shall transit to CELL\_FACH state and then respond with a PHYSICAL CHANNEL RECONFIGURATION COMPLETE message. SS monitor the uplink DCCH once more to verify that no MEASUREMENT REPORT messages are detected. SS modifies the contents of Master Information Block and System Information Block type 12 messages, and then send SYSTEM INFORMATION CHANGE INDICATION message to UE. This is followed by a reconfiguration of the downlink transmission power of the respect cells according to the settings in columns "T1" in table 8.4.1.7-1. SS starts timer T305 and then waits for it to expire. The UE shall discover an "out-of-service" condition and initiate a cell re-selection procedure. This is verified in the SS when a CELL UPDATE message is received on the uplink CCCH with the "cell update cause" IE set to "cell reselection". SS transmits a CELL UPDATE CONFIRM message on the DCCH to end the cell update procedure. Next, SS sends a RADIO BEARER RECONFIGURATION message on the downlink DCCH, assigning dedicated physical channels in both uplink and downlink directions. The UE shall respond with a RADIO BEARER RECONFIGURATION COMPLETE message and then return to CELL\_DCH state. SS checks that the UE does not generate any MEASUREMENT REPORT messages on the uplink DCCH.

## Expected Sequence

| Step | Direction |    | Message                                   | Comment                                                                                                                                                                                                                       |

**CELL UPDATE (Step 22)**

| Information Element        | Value/Remarks                                     |
|----------------------------|---------------------------------------------------|
| U-RNTI                     |                                                   |
| -SRNC Identity             | Check to see if set to '0000-0000-0001'           |
| -S-RNTI                    | Check to see if set to '0000-0000-0000-0000-0001' |
| Cell Update Cause          | Check to see if set to 'Cell Re-selection'        |
| Protocol error indicator   | Check to see if it is absent or set to 'FALSE'    |
| Measured results on RACH   | Check to see if it is absent                      |
| Protocol error information | Check to see if it is absent                      |

**CELL UPDATE CONFIRM (Step 23)**

Use the default message content of the same message type in Annex A.

**8.4.1.7.5 Test Requirement**

After step 3 the UE shall report cell 2's CPICH RSCP value by transmitting MEASUREMENT REPORT messages.

After step 5 the UE shall delete all measurement and reporting contexts obtained from System Information Block type 12 messages. It shall transmit MEASUREMENT REPORT messages which contain measured results of cell 3's CPICH RSCP value only

After step 9 and step 11 the UE shall not transmit MEASUREMENT REPORT messages, which pertain to intra-frequency type measurement reporting.

After step 13 the UE shall resume the measurement and reporting activities as specified in MEASUREMENT CONTROL message received in step 10. The UE shall transmit MEASUREMENT REPORT messages, containing measured results of cell 2's CPICH RSCP value.

After step 15 the UE shall stop measurement activities pertaining to periodic reporting of cell 2's CPICH RSCP, no MEASUREMENT REPORT messages shall be detectable by the SS on the uplink DCCH.

After step 21 the UE shall re-select to cell 2 and initiate a cell update procedure. SS shall receive a CELL UPDATE message on the uplink CCCH of cell 2, with the "cell update cause" IE stated as "cell re-selection".

After step 25 the UE shall not resume measurements and any associated reporting activities for cell 3's CPICH RSCP, no MEASUREMENT REPORT messages shall be detectable by the SS in the uplink DCCH.

**8.4.1.8 Measurement Control and Report: Inter-frequency measurement for transition from CELL\_FACH to CELL\_DCH state****8.4.1.8.1 Definition****8.4.1.8.2 Conformance requirement**

When transiting from CELL\_FACH state to CELL\_DCH state, the UE shall stop monitoring the list of cells assigned in the IE "inter-frequency cell info" in System Information Block type 11 or 12 messages. If the UE has stored measurement control information of type "inter-frequency" for which the IE "measurement validity" is present and the IE "UE state for reporting" has been assigned to "CELL\_DCH", it shall resume the stored measurement reporting activities after it has re-entered CELL\_DCH state from CELL\_FACH state. The UE shall activate or deactivate inter-frequency measurements by decoding the "DPCH compressed mode status info" IE in MEASUREMENT CONTROL messages.

**Reference**

3GPP TS 25.331 clause 8.4.1.7.2, 8.4.1.3

### 8.4.1.8.3 Test Purpose

To confirm that the UE stops monitoring the list of cells assigned in the IE "inter-frequency cell info" in System Information Block type 11 or 12 when it transits from CELL\_FACH state to CELL\_DCH state. To confirm that the UE resumes inter-frequency measurements and reporting stored for which the measurement control information has IE "measurement validity" assigned to the value "CELL\_DCH", after it re-enters CELL\_DCH state from CELL\_FACH state. To confirm that the UE resumes inter-frequency measurement and reporting activities after it has received a MEASUREMENT CONTROL message specifying that a stored compressed mode pattern sequence be re-activated.

### 8.4.1.8.4 Method of test

#### Initial Condition

System Simulator: 3 cells—Cells 1, cell 4 and cell 5 are active.

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

#### Test Procedure

Table 8.4.1.8-1 illustrates the downlink power to be applied for the 3 cells in this test.

**Table 8.4.1.8-1**

| Para-meter             | Unit         | Cell 1 | Cell 4 | Cell 5 |
|------------------------|--------------|--------|--------|--------|
| UTRA-RF Channel Number |              | Ch. 1  | Ch. 2  | Ch. 2  |
| CPICH Ec               | dBm/3.84 MHz | -60    | -75    | -75    |

The UE is in CELL\_DCH state in cell 1. SS transmits MEASUREMENT CONTROL message to add cell 5 into the IE "inter-frequency cell info". In the MEASUREMENT CONTROL message, the parameters of the IE "inter-frequency measurement reporting criteria" are as follow: event-triggered with event identity='2c', reporting quantity = "CPICH RSCP", threshold for non-used frequency = '-85 dBm', hysteresis = '1.0dB', time to trigger = '10 seconds', amount of reporting = '1' and reporting interval = '0'. In the same message, IE "Measurement validity" is present and "UE state" is assigned the value 'CELL\_DCH'. SS checks that no MEASUREMENT REPORT messages are detected on the uplink DCCH after it has transmitted the MEASUREMENT CONTROL message.

SS sends a PHYSICAL CHANNEL RECONFIGURATION message on the downlink DCCH and configures PRACH and S-CCPCH physical channels. The UE shall reconfigure itself to receive and transmit using the new common physical channels assigned, and send PHYSICAL CHANNEL RECONFIGURATION COMPLETE on the uplink DCCH. SS modifies the content of Master Information Block and System Information Block type 12 messages, such that cell 4 is added in the list of cells assigned in the IE "inter-frequency cell info". SS transmits SYSTEM INFORMATION CHANGE INDICATION message to UE. Once again, SS verifies that the UE does not transmit MEASUREMENT REPORT messages in the uplink direction.

SS sends PHYSICAL CHANNEL RECONFIGURATION message, and configures dedicated physical. In this message, SS commands the UE to start applying compressed mode mechanism for DPCH. The UE shall move to CELL\_DCH state and then reply with PHYSICAL CHANNEL RECONFIGURATION COMPLETE message. SS waits for 10 seconds. The UE shall transmit 1 MEASUREMENT REPORT message, containing the selected frequency quality estimate (in this case CPICH RSCP) of cell 5. The UE shall also report the triggering of event '2c' in the IE "Event results" of MEASUREMENT REPORT message. SS verifies that this message does not contain measured results for cell 4.

SS transmits a MEASUREMENT CONTROL message on the downlink DCCH using AM-RLC. In this message, SS modifies the measurement control information for measurement identity = "14" and set IE "CHOICE reporting criteria" to "periodic reporting criteria". The UE shall transmit MEASUREMENT REPORT messages at 2 seconds interval. SS transmits a PHYSICAL CHANNEL RECONFIGURATION message and deactivates the compressed mode pattern sequence with "TGPSI" IE set to 1. The UE shall respond by sending PHYSICAL CHANNEL RECONFIGURATION COMPLETE message and also stop the periodic reporting activities. Following this, SS sends a MEASUREMENT CONTROL message and re-activates the compressed mode pattern sequence by using the "DPCH compressed mode status" IE. SS confirms that the UE has reconfigured itself to start measurement reporting again. The SS shall be able to receive MEASUREMENT REPORT messages continuously at 2 seconds interval.

#### Expected Sequence

| Step | Direction |    | Message                                                      | Comment                                                                                                                                                |
|------|-----------|----|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                                              |                                                                                                                                                        |
| 1    |           |    |                                                              | The initial state of UE is in CELL_DCH state of cell 1.                                                                                                |
| 2    |           | ←  | MEASUREMENT CONTROL                                          | SS specifies inter-frequency measurement and reporting parameters for cell 5, with "measurement validity" IE present and "UE state" set to "CELL_DCH". |
| 3    |           |    |                                                              | SS checks that no MEASUREMENT REPORT messages are detected on the uplink DCCH.                                                                         |
| 4    |           | ←  | PHYSICAL CHANNEL RECONFIGURATION                             | SS configures PRACH and S-CCPCH physical resources.                                                                                                    |
| 5    |           | →  | PHYSICAL CHANNEL RECONFIGURATION COMPLETE                    | UE shall move to CELL_FACH state.                                                                                                                      |
| 6    |           | ←  | Master Information Block<br>System Information Block type 12 | SS modifies MIB and SIB 12 in order to include cell 4 into the list of cells in IE "inter-frequency cell info".                                        |
| 7    |           | ←  | SYSTEM INFORMATION CHANGE INDICATION                         | After SS transmits this message, SS confirms that there are no transmissions of MEASUREMENT REPORT message in the uplink direction.                    |
| 8    |           | ←  | PHYSICAL CHANNEL RECONFIGURATION                             | SS configures dedicated physical channels with compressed mode parameters                                                                              |
| 9    |           | →  | PHYSICAL CHANNEL RECONFIGURATION COMPLETE                    | UE shall move to CELL_DCH state.                                                                                                                       |
| 10   |           | →  | MEASUREMENT REPORT                                           | UE shall resume inter-frequency measurement task for cell 5 and report the measured CPICH RSCP value for cell 5.                                       |
| 11   |           | ←  | MEASUREMENT CONTROL                                          | SS changes the reporting criteria for cell 5 to 'periodic reporting'                                                                                   |
| 12   |           | →  | MEASUREMENT REPORT                                           | UE shall begin to transmit this message at 2 seconds interval.                                                                                         |
| 13   |           | ←  | PHYSICAL CHANNEL RECONFIGURATION                             | SS deactivates the currently used pattern sequence for compressed mode operation.                                                                      |
| 14   |           | →  | PHYSICAL CHANNEL RECONFIGURATION COMPLETE                    | UE stays in CELL_DCH state. SS verifies that no MEASUREMENT REPORT messages are received.                                                              |
| 15   |           | ←  | MEASUREMENT CONTROL                                          | SS activates the pattern sequence stored by the UE.                                                                                                    |

| Step | Direction |    | Message            | Comment                                                                        |
|------|-----------|----|--------------------|--------------------------------------------------------------------------------|

## 8.4.1.8.5 Test Requirement

After step 2 the UE shall not send any MEASUREMENT REPORT messages on the uplink DCCH of cell 1.

After step 9 the UE shall transmit a MEASUREMENT REPORT message, containing the IE "measured results" reporting cell 5's CPICH RSCP value. The UE shall also report the triggering of event '2c' by including IE "Event

results" in the MEASUREMENT REPORT message. The UE shall not transmit any MEASUREMENT REPORT messages pertaining to cell 4's measurements.

After step 11 the UE shall send MEASUREMENT REPORT messages, containing cell 5's CPICH RSCP measured value in IE "Measured results" at 2 seconds interval. The "Event results" IE shall be omitted in these messages.

After step 14 the UE shall not transmit any MEASUREMENT REPORT messages.

After step 15 the UE shall resume the transmission of MEASUREMENT REPORT messages with identical contents as in those received after step 11.

#### ~~8.4.1.9 Measurement Control and Report: Unsupported measurement in the UE~~

##### ~~8.4.1.9.1 Definition~~

##### ~~8.4.1.9.2 Conformance requirement~~

If the UTRAN instructs the UE to perform a measurement that is not supported by the UE, the UE shall keep the measurement configuration that was valid before the MEASUREMENT CONTROL message was received. Then the UE shall transmit a MEASUREMENT CONTROL FAILURE message on the DCCH using AM RLC.

#### Reference

3GPP TS 25.331 clause 8.4.1.4

##### ~~8.4.1.9.3 Test purpose~~

To confirm that the UE transmits a MEASUREMENT CONTROL FAILURE message, with the value "unsupported measurement" in IE "failure cause" when the SS instructs the UE to perform an unsupported measurement by sending a MEASUREMENT CONTROL message. To confirm that the UE retains its existing valid measurement configuration, after receiving a MEASUREMENT CONTROL message containing an unsupported measurement.

##### ~~8.4.1.9.4 Method of test~~

#### Initial Condition

System Simulator: 1cell

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

[Editor's note: It is assumed in this test that the UE under test does not possess any inter-RAT measurement capability. The mandatory type(s) of measurement capability that shall be implemented by the UE is to be discussed]

#### Test Procedure

The UE is in the CELL\_DCH state. SS sends MEASUREMENT CONTROL message to command the UE to perform internal measurement and reporting for UE transmitted power. The UE shall transmit MEASUREMENT REPORT messages on DCCH at 1 second interval. The SS transmits a MEASUREMENT CONTROL message to configure inter-RAT measurements. The UE shall transmit a MEASUREMENT CONTROL FAILURE message on the uplink DCCH using AM RLC. SS verifies that the UE continues to transmit MEASUREMENT REPORT messages on uplink DCCH.

| Information Element        | Value/Remarks                                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------|
| RRC transaction identifier | Check if it is set to the same value of the same IE in the MEASUREMENT CONTROL message sent in Step 4. |
| Failure cause              | Check if it is set to "Unsupported measurement"                                                        |

## 8.4.1.9.5 Test requirement

After step 2 the UE shall transmit a MEASUREMENT REPORT messages at 1 second interval. In these messages, the IE "CHOICE measurement" shall be set to "UE internal measured results", and it shall contain the measured UL transmitted power reading in IE "UE Transmitted Power".

After step 4 the UE shall transmit a MEASUREMENT CONTROL FAILURE message. In this message, the value "unsupported measurement" shall be specified in IE "failure cause".

After step 5 the UE shall continue to transmit MEASUREMENT REPORT messages on the uplink DCCH, with the contents of the messages identical to that received by SS after step 2.

### 8.4.1.10 ~~Measurement Control and Report: Failure (Invalid Message Reception)~~

#### 8.4.1.10.1 ~~Definition~~

#### 8.4.1.10.2 ~~Conformance requirement~~

When the UE received an invalid MEASUREMENT CONTROL message it shall reply with a MEASUREMENT CONTROL FAILURE message stating the appropriate protocol error information. It shall continue its ongoing processes and procedures as if the MEASUREMENT CONTROL message has not been received.

#### Reference

3GPP TS 25.331 clauses 8.4.1.5 and 9.2

#### 8.4.1.10.3 ~~Test Purpose~~

To confirm that the UE continues its ongoing processes and procedures after it has received an invalid MEASUREMENT CONTROL message. To confirm that the UE transmits MEASUREMENT CONTROL FAILURE message, after it has received an invalid MEASUREMENT CONTROL message.

#### 8.4.1.10.4 ~~Method of test~~

#### Initial Condition

System Simulator: 1 cell.

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

#### Test Procedure

The UE is initially brought to CELL\_DCH. SS transmits a MEASUREMENT CONTROL message to the UE, commanding it to start transmitting report messages for the reporting quantity "UE Transmitted Power". SS waits for the UE to transmit MEASUREMENT RERORT message on the uplink DCCH. After the MEASUREMENT REPORT message is received, SS transmits an invalid MEASUREMENT CONTROL message again. The UE shall reply with MEASURMENT CONTROL FAILURE message as it has detected a protocol error. It shall continue to report its UL transmission power level using MEASUREMENT REPORT messages.

#### Expected Sequence

| Step | Direction |    | Message             | Comment                                                                                                           |
|------|-----------|----|---------------------|-------------------------------------------------------------------------------------------------------------------|

| Event Results               | Check to see if this IE is absent                              |

#### MEASUREMENT-CONTROL (Step-4)

| Information Element | Value/Remark |
|---------------------|--------------|
| All IEs             | Not Present  |

**MEASUREMENT CONTROL FAILURE (Step 5)**

| Information Element        | Value/Remark                                               |
|----------------------------|------------------------------------------------------------|
| Failure cause              | Check to see if set to "protocol error"                    |
| Protocol error information | Check to see if set to "ASN.1 violation or encoding error" |

**8.4.1.10.5 — Test Requirement**

After step 4 the UE shall transmit MEASUREMENT CONTROL FAILURE message, stating the IE "failure cause" as "protocol error" and IE "protocol error information" as "ASN.1 violation or encoding error".

After step 5 the UE shall continue to send MEASUREMENT REPORT, with the measurement identity number set to 3 and "measured results" IE containing measured readings of UE Tx power, at 32 seconds interval.

**8.4.1.11 — Measurement Control and Report: Compressed Mode Configuration Failure during radio bearer reconfiguration procedure****8.4.1.11.1 — Definition****8.4.1.11.2 — Conformance requirement**

During a radio bearer reconfiguration procedure, the UTRAN might request the activation of a new transmission gap pattern sequence configuration. If the UE detects a runtime error due to overlapping compressed mode configuration, it shall delete the transmission gap pattern sequence configuration associated with highest value of TGPSI. The UE shall also terminate any inter-frequency / inter-RAT measurements corresponding to the deleted transmission gap pattern sequence. The UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the DCCH using AM-RLC, with the IE "failure cause" set to "compressed mode runtime error".

**Reference**

3GPP TS 25.331 clause 8.2.2, clause 8.2.11.2, clause 8.6.6.15

**8.4.1.11.3 — Test purpose**

To confirm that the UE transmits a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the uplink DCCH using AM-RLC, if it receives a RADIO BEARER RECONFIGURATION message which includes IE "DPCH compressed mode info" that causes an illegal overlap involving more than one parallel transmission gap pattern sequences. To confirm that the UE terminate any inter-frequency measurements corresponding to the deleted transmission gap pattern sequence.

**8.4.1.11.4 — Method of test****Initial Condition**

System Simulator: 2 cells — Cell 1 and cell 4 are active.

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) as specified in TS34.108 clause 7.4, depending on the CN domain supported.

**Test Procedure**

Table 8.4.1.11-1 illustrates the downlink power to be applied for the 2 cells in this test case.

**Table 8.4.1.11-1**

| Parameter              | Unit                | Cell 1 | Cell 4 |
|------------------------|---------------------|--------|--------|
| UTRA-RF Channel Number |                     | Ch. 1  | Ch. 2  |
| CPICH Ec               | dBm/<br>3.84<br>MHz | -60    | -70    |

The UE is in the CELL\_DCH state in cell 1. SS sends a MEASUREMENT CONTROL message on the downlink DCCH to request the UE to start inter-frequency measurement for cell 4's CPICH Ec/No value, and also to report the UTRA RSSI in the UARFCN in which cell 4 resides. Simultaneously, the stored transmission gap pattern sequence configuration associated with TGPSI=1 is indicated to be activated in this message. The UE shall transmit MEASUREMENT REPORT messages periodically at 16 seconds interval to report the RSSI value of UTRA carrier in which cell 4 resides. Next, SS sends a second MEASUREMENT CONTROL message. In this message, a new measurement task is to be established for the measurement and reporting of "GSM carrier RSSI" on a periodic basis. A deactivated transmission pattern gap sequence configuration (with TGPSI=2) is associated with this new measurement task.

The SS transmits a RADIO BEARER RECONFIGURATION message and commands the activation of transmission gap pattern sequence with TGPSI=2. The UE then shall transmit a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the DCCH using AM RLC. In this message, the value of IE "failure cause" shall be set to "compressed mode runtime error". The UE shall terminate all inter-RAT measurement tasks associated with TGPSI=2. The UE shall continue to send MEASUREMENT REPORT messages to report the UTRA RSSI in the UARFCN in which cell 4 resides.

|------------------------------|----------------------------------------------------------|
| Failure-cause                | Checked to see if set to "compressed mode runtime error" |
| → Protocol error information | Checked to see if it is absent                           |
| → Deleted TGPSI              | Checked to see if it is set to "2"                       |

**8.4.1.11.5 → Test requirement**

After step 6 the UE shall keep transmission gap pattern sequence configuration associated with TGPSI=1. It shall delete the transmission gap pattern sequence configuration associated with TGPSI=2, and delete the inter-RAT measurements corresponding to it. It shall transmit PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the uplink DCCH, with the IE "Failure-cause" set to "Compressed mode runtime error".

After step 7 the UE shall continue to send MEASUREMENT REPORT messages periodically, to report the UTRA RSSI value for the UARFCN in which cell 4 resides. The MEASUREMENT REPORT messages sent by the UE shall not contain CPICH RSCP readings for cell 4.

### ~~8.4.1.12 Measurement Control and Report: Compressed Mode Configuration Failure during transport channel reconfiguration procedure~~

#### ~~8.4.1.12.1 Definition~~

#### ~~8.4.1.12.2 Conformance requirement~~

~~During a transport channel reconfiguration procedure, the UTRAN might request the activation of a new transmission gap pattern sequence configuration. If the UE detects a runtime error due to overlapping compressed mode configuration, it shall delete the transmission gap pattern sequence configuration associated with highest value of TGPSI. The UE shall also terminate any inter-frequency / inter-RAT measurements corresponding to the deleted transmission gap pattern sequence. The UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the DCCH using AM-RLC, with the cause value in IE "failure cause" set to "compressed mode runtime error".~~

#### ~~Reference~~

~~3GPP TS 25.331 clause 8.2.2, clause 8.2.11.2, clause 8.6.6.15~~

#### ~~8.4.1.12.3 Test purpose~~

~~To confirm that the UE transmits a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the uplink DCCH using AM-RLC, if it receives a TRANSPORT CHANNEL RECONFIGURATION message which includes IE "DPCH compressed mode info" that causes an illegal overlap involving more than one parallel transmission gap pattern sequences. To confirm that the UE terminate any measurements corresponding to the deleted transmission gap pattern sequence.~~

#### ~~8.4.1.12.4 Method of test~~

#### ~~Initial Condition~~

~~System Simulator: 2 cells—Cell 1 and cell 4 are active.~~

~~UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) as specified in TS34.108 clause 7.4, depending on the CN domain supported.~~

#### ~~Test Procedure~~

~~For this test case, the downlink transmission power settings shall follow that specified in table 8.4.1.11-1 in clause 8.4.1.11.4.~~

~~The UE is in the CELL\_DCH state in cell 1. SS sends a MEASUREMENT CONTROL message on the downlink DCCH to request the UE to start inter-frequency measurement for cell 4's CPICH Ec/No value, and also to report the UTRA RSSI in the UARFCN in which cell 4 resides. Simultaneously, the stored transmission gap pattern sequence configuration associated with TGPSI=1 is indicated to be activated in this message. The UE shall transmit MEASUREMENT REPORT messages periodically at 16 seconds interval to report the RSSI value of UTRA carrier in which cell 4 resides. Next, SS sends a second MEASUREMENT CONTROL message. In this message, a new measurement task is to be established for the measurement and reporting of "GSM carrier RSSI" on a periodic basis. A deactivated transmission pattern gap sequence configuration (with TGPSI=2) is associated with this new measurement task.~~

~~The SS transmits a TRANSPORT CHANNEL RECONFIGURATION message and commands the activation of transmission gap pattern sequence with TGPSI=2. The UE then shall transmit a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the DCCH using AM-RLC. In this message, the value of IE "failure cause" shall be set to "compressed mode runtime error". The UE shall terminate all inter-RAT measurement tasks associated with TGPSI=2. The UE shall continue to send MEASUREMENT REPORT messages to report the UTRA RSSI in the UARFCN in which cell 4 resides.~~

## Expected sequence

| Step | Direction |    | Message                                  | Comment                                                                                                                                                                                            |

#### PHYSICAL CHANNEL RECONFIGURATION FAILURE (Step 7)

| Information Element          | Value/remark                                             |
|------------------------------|----------------------------------------------------------|
| Failure-cause                | Checked to see if set to "compressed mode runtime error" |
| → Protocol error information | Checked to see if it is absent                           |
| → Deleted TGPSI              | Checked to see if it is set to "2"                       |

#### 8.4.1.12.5 → Test requirement

After step 6 the UE shall keep transmission gap pattern sequence configuration associated with TGPSI=1. It shall delete the transmission gap pattern sequence configuration associated with TGPSI=2, and delete the inter-RAT measurements corresponding to it. It shall transmit PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the uplink DCCH, with the IE "Failure-cause" set to "Compressed mode runtime error".

After step 7 the UE shall continue to send MEASUREMENT REPORT messages periodically, to report the UTRA RSSI value for the UARFCN in which cell 4 resides. The, MEASUREMENT REPORT messages sent by the UE shall not contain CPICH RSCP readings for cell 4.

### 8.4.1.13 Measurement Control and Report: Compressed Mode Configuration Failure during physical channel reconfiguration procedure

#### 8.4.1.13.1 Definition

#### 8.4.1.13.2 Conformance requirement

During a physical channel reconfiguration procedure, the UTRAN might request the activation of a new transmission gap pattern sequence configuration. If the UE detects a runtime error due to overlapping compressed mode configuration, it shall delete the transmission gap pattern sequence configuration associated with highest value of TGPSI. The UE shall also terminate any inter-frequency / inter-RAT measurements corresponding to the deleted transmission gap pattern sequence. The UE shall transmit a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the DCCH using AM-RLC, with the IE "failure cause" set to "compressed mode runtime error".

#### Reference

3GPP TS 25.331 clause 8.2.2, clause 8.2.11.2, clause 8.6.6.14

#### 8.4.1.13.3 Test purpose

To confirm that the UE transmits a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the uplink DCCH using AM-RLC, if it receives a PHYSICAL CHANNEL RECONFIGURATION message which includes IE "DPCH compressed mode info" that causes an illegal overlap involving more than one parallel transmission gap pattern sequences. To confirm that the UE terminate any inter-frequency measurements corresponding to the deleted transmission gap pattern sequence

#### 8.4.1.13.4 Method of test

##### Initial Condition

System Simulator: 2 cells—Cell 1 and cell 4 are active.

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) as specified in TS34.108 clause 7.4, depending on the CN domain supported.

##### Test Procedure

For this test case, the downlink transmission power settings shall follow that specified in table 8.4.1.11-1 in clause 8.4.1.11.4.

The UE is in the CELL\_DCH state in cell 1. SS sends a MEASUREMENT CONTROL message on the downlink DCCH to request the UE to start inter-frequency measurement for cell 4's CPICH Ec/No value, and also to report the UTRA RSSI in the UARFCN in which cell 4 resides. Simultaneously, the stored transmission gap pattern sequence configuration associated with TGPSI=1 is indicated to be activated in this message. The UE shall transmit MEASUREMENT REPORT messages periodically at 16 seconds interval to report the RSSI value of UTRA carrier in which cell 4 resides. Next, SS sends a second MEASUREMENT CONTROL message. In this message, a new measurement task is to be established for the measurement and reporting of "GSM carrier RSSI" value on a periodic basis. A deactivated transmission pattern gap sequence configuration (with TGPSI=2) is associated with this new measurement task.

The SS transmits a PHYSICAL CHANNEL RECONFIGURATION message and commands the activation of transmission gap pattern sequence with TGPSI=2. The UE then shall transmit a PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the DCCH using AM-RLC. In this message, the value of IE "failure cause" shall be set to "compressed mode runtime error". The UE shall terminate all inter-RAT measurement tasks associated with TGPSI=2. The UE shall continue to send MEASUREMENT REPORT messages to report the UTRA RSSI in the UARFCN in which cell 4 resides.

## Expected sequence

### PHYSICAL CHANNEL RECONFIGURATION FAILURE (Step 7)

| Information Element          | Value/remark                                             |
|------------------------------|----------------------------------------------------------|
| Failure-cause                | Checked to see if set to "compressed mode runtime error" |
| → Protocol error information | Checked to see if it is absent                           |
| → Deleted TGPSI              | Checked to see if it is set to "2"                       |

#### 8.4.1.13.5 → Test requirement

After step 6 the UE shall keep transmission gap pattern sequence configuration associated with TGPSI=1. It shall delete the transmission gap pattern sequence configuration associated with TGPSI=2, and delete the inter-RAT measurements corresponding to it. It shall transmit PHYSICAL CHANNEL RECONFIGURATION FAILURE message on the uplink DCCH, with the IE "Failure-cause" set to "Compressed mode runtime error".

After step 7 the UE shall continue to send MEASUREMENT REPORT messages periodically, to report the UTRA RSSI value for the UARFCN in which cell 4 resides. The MEASUREMENT REPORT messages sent by the UE shall not contain the CPICH RSCP readings for cell 4.

#### 8.4.1.14 ~~Measurement Control and Report: Cell forbidden to affect reporting range~~

##### 8.4.1.14.1 ~~Definition~~

##### 8.4.1.14.2 ~~Conformance requirement~~

When event 1A is ordered by the UTRAN in a MEASUREMENT CONTROL message, the UE shall send a MEASUREMENT REPORT message when a primary CPICH measured has entered the specified reporting range. The UTRAN can request that a certain primary CPICH be forbidden to affect the reporting range used for event 1A measurement reporting. However, the UE shall ignore such a request from the UTRAN if two conditions are fulfilled – (a) the primary CPICH concerned is included in the active set, and (b) all cells in the active set are defined as primary CPICHs forbidden to affect the reporting range.

##### Reference

3GPP TS 25.331 clause 14.1.2.1, clause 14.1.5.4

##### 8.4.1.14.3 ~~Test Purpose~~

To confirm that the UE reports the triggering of event 1A to the SS, if a primary CPICH currently measured by the UE enters the reporting range. To confirm that the UE ignores that a primary CPICH is forbidden to affect the reporting range when (a) the primary CPICH concerned is included in active set and (b) all cells in the active set are defined as primary CPICHs forbidden to affect the reporting range.

##### 8.4.1.14.4 ~~Method of test~~

##### Initial Condition

System Simulator: 3 cells – Cell 1, cell 2 and cell 3 are active.

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

##### Test Procedure

Table 8.4.1.14-1 illustrates the downlink power to be applied for the 3 cells at various time instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1", "T2" and "T3" are to be applied subsequently. The exact instants on which these values shall be applied are described in the text in this clause.

**Table 8.4.1.14-1**

| Parameter              | Unit          | Cell 1 |     |     |     | Cell 2 |     |     |     | Cell 3 |     |     |     |
|------------------------|---------------|--------|-----|-----|-----|--------|-----|-----|-----|--------|-----|-----|-----|
|                        |               | T0     | T1  | T2  | T3  | T0     | T1  | T2  | T3  | T0     | T1  | T2  | T3  |
| UTRA RF Channel Number |               | Ch. 1  |     |     |     | Ch. 1  |     |     |     | Ch. 1  |     |     |     |
| CPICH Ec               | dBm /3.84 MHz | -60    | -60 | -85 | -60 | -85    | -70 | -60 | -85 | -70    | -70 | -85 | -70 |

The UE is initially in CELL\_DCH state of cell 1.

SS sends a MEASUREMENT CONTROL message with cell 1, cell 2 and cell 3 listed in IE "intra-frequency cell info list". In this message the IE "CHOICE reporting criteria" is set to "intra-frequency measurement report criteria", with the IE "intra-frequency event identity" set to "1A". The IE "reporting range" is set to 5 dB in the MEASUREMENT CONTROL message. The UE shall send a MEASUREMENT REPORT on the uplink DCCH, which contains the IE "Event results" to report that intra-frequency event 1A is triggered by cell 3.

SS executes the active set update procedure, requesting that cell 3 be added to the active set. The UE shall respond with ACTIVE SET UPDATE COMPLETE message on the uplink DCCH and then include cell 3 into its current active set. SS configures itself according to the values in columns "T1" shown above. The UE shall transmit a MEASUREMENT REPORT message on the uplink DCCH to report the triggering of intra-frequency event 1A. In these messages, the IE "Events results" shall indicate that intra-frequency event 1A is triggered by cell 2. Upon reception of MEASUREMENT REPORT message, SS sends ACTIVE SET UPDATE message to request cell 2 to be added to the active set. The UE shall respond with ACTIVE SET UPDATE COMPLETE message on the uplink DCCH and then include cell 2 into its current active set.

SS sends a MEASUREMENT CONTROL message to command that all cells in the active set are forbidden to update the reporting range for event 1A. SS configures itself according to the values in columns "T2" shown above. The UE shall not transmit a MEASUREMENT REPORT message on the uplink to report the triggering of intra-frequency reporting event 1A. SS reconfigures itself according to the values in column "T3" shown in table 8.4.1.14-1 above. The UE shall transmit MEASUREMENT REPORT message to report triggering intra-frequency event identity 1A, and also to report the CPICH RSCP readings for cell 1, cell 2 and cell 3 in IE "Measured results".

## Expected sequence

| Step | Direction |    | Message                    | Comment                                                                                                                                                                                                                                                                   |

| Cell measured results               |                                                                    |
| Cell Identity                       | Check to see if it is absent                                       |
| SFN-SFN observed time difference    | Check to see if this IE is absent                                  |
| Cell synchronisation information    | Check to see if this IE is absent                                  |
| Primary CPICH Info                  |                                                                    |
| Primary Scrambling Code             | Check to see if it's the same code for cell 3                      |
| CPICH Ec/No                         | Check to see if this IE is absent                                  |
| CPICH RSCP                          | Check to see if this IE is present                                 |
| Pathloss                            | Check to see if this IE is absent                                  |
| Cell measured results               |                                                                    |
| Cell Identity                       | Check to see if it is absent                                       |
| SFN-SFN observed time difference    | Check to see if this IE is absent                                  |
| Cell synchronisation information    | Check to see if this IE is absent                                  |
| Primary CPICH Info                  |                                                                    |
| Primary Scrambling Code             | Check to see if it's the same code for cell 2                      |
| CPICH Ec/No                         | Check to see if this IE is absent                                  |
| CPICH RSCP                          | Check to see if this IE is present                                 |
| Pathloss                            | Check to see if this IE is absent                                  |
| Measured Results on RACH            | Check to see if this IE is absent                                  |
| Additional Measured Results         | Check to see if this IE is absent                                  |
| Event Results                       | Check to see if set to 'Intra-frequency measurement event results' |
| Intra-frequency event identity      | Check to see if set to '1a'                                        |
| Cell measurement event results      |                                                                    |
| CHOICE Mode                         | Check to see if set to 'FDD'                                       |
| Primary CPICH info                  |                                                                    |
| Primary Scrambling Code             | Check to see if set to the same code for cell 3                    |

## 8.4.1.14.5 Test requirement

After step 5, the UE shall send a MEASUREMENT REPORT message on the uplink DCCH. The message shall contain the IE "Event results" to report that cell 3 has triggered intra-frequency event 1A.

After step 9, the UE shall transmit MEASUREMENT REPORT message on the uplink DCCH. The message shall contain IE "Event results" to report that cell 2 has triggered intra-frequency event 1A.

After step 12, the UE shall not send MEASUREMENT REPORT message on the uplink DCCH to report the triggering of intra-frequency event identity 1A.

After step 14, the UE shall send a MEASUREMENT REPORT message on the uplink DCCH. The message shall contain IE "Event results" to report that cell 3 has triggered intra-frequency event 1A.

### ~~8.4.1.15 Measurement Control and Report: Configuration Incomplete~~

#### ~~8.4.1.15.1 Definition~~

#### ~~8.4.1.15.2 Conformance requirement~~

~~When the UE received a MEASUREMENT CONTROL message which results in an "configuration incomplete" condition to be detected, the UE shall retain the measurement configuration that was valid before the MEASUREMENT CONTROL message was received. It shall also send MEASUREMENT CONTROL FAILURE, with the IE "RRC transaction identifier" set to the value of the same IE in the received MEASUREMENT CONTROL message, and also the "failure-cause" IE set to "incomplete configuration".~~

#### ~~Reference~~

~~3GPP TS 25.331 clause 8.4.1.4a, 8.6.7.10, 8.6.7.13, 8.6.7.14, 8.6.7.16, 8.6.7.17, 8.6.7.18~~

#### ~~8.4.1.15.3 Test Purpose~~

~~To confirm that the UE sends a MEASUREMENT CONTROL FAILURE message, after receiving a MEASUREMENT CONTROL message with IE "Measurement command" set to "Setup" and the following contents:~~

- ~~— "CHOICE measurement type" IE is set to "Intra-frequency measurement" and "Intra-frequency measurement quantity" is omitted; or~~
- ~~— "CHOICE measurement type" IE is set to "Inter-frequency measurement" and "Inter-frequency reporting quantity" is omitted; or~~
- ~~— "Reporting mode" IE is omitted. or~~
- ~~— "CHOICE measurement type" IE is set to "Quality measurement" and IE "Quality reporting quantity" is omitted or~~
- ~~— "CHOICE measurement type" IE is set to "UE internal measurement" and IE "UE internal measurement quantity" is omitted or~~
- ~~— "CHOICE measurement type" IE is set to "UE internal measurement" and IE "UE internal reporting quantity" is omitted or~~
- ~~— "CHOICE measurement type" IE is set to "Traffic volume measurement" and IE "Traffic volume measurement quantity" is omitted or~~
- ~~— "CHOICE measurement type" IE is set to "Traffic volume measurement" and IE "Traffic volume reporting quantity" is omitted~~

~~To confirm that the UE set the "failure-cause" IE to value "incomplete configuration" in the uplink MEASUREMENT CONTROL FAILURE message.~~

#### ~~8.4.1.15.4 Method of test~~

##### ~~Initial Condition~~

~~System Simulator: 1 cell.~~

~~UE: CS-DCCH\_DCH (State 6-5) or PS-DCCH\_DCH (State 6-7) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.~~

##### ~~Test Procedure~~

~~The UE is initially brought to CELL\_DCH. SS transmits a MEASUREMENT CONTROL message to the UE, commanding it to start an intra-frequency measurement and reporting task. However, IE "Intra-frequency measurement quantity" is absent in the message. The UE shall not establish the intra-frequency measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.~~

Next, SS sends the MEASUREMENT CONTROL message once more. In this message, SS commands the establishment of an inter-frequency measurement and reporting task, but IE "Inter-frequency reporting quantity" is omitted in this message. The UE shall not establish the intra-frequency measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.

Next, SS sends a third MEASUREMENT CONTROL message. In this message, SS commands the establishment of an intra-frequency measurement and reporting task, but IE "Measurement reporting mode" is omitted in this message. The UE shall not establish the intra-frequency measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.

Next, SS sends a fourth MEASUREMENT CONTROL message. In this message, SS commands the establishment of a quality measurement and reporting task, but IE "Quality reporting quantity" is omitted in this message. The UE shall not establish the quality measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.

Next, SS sends a fifth MEASUREMENT CONTROL message. In this message, SS commands the establishment of UE internal measurement and reporting task, but IE "UE internal measurement quantity" is omitted in this message. The UE shall not establish the UE internal measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.

Next, SS sends a sixth MEASUREMENT CONTROL message. In this message, SS commands the establishment of UE internal measurement and reporting task, but IE "UE internal reporting quantity" is omitted in this message. The UE shall not establish the UE internal measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.

Next, SS sends a seventh MEASUREMENT CONTROL message. In this message, SS commands the establishment of a traffic volume measurement and reporting task, but IE "Traffic volume measurement quantity" is omitted in this message. The UE shall not establish the traffic volume measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.

In the final sequence, SS sends an eight MEASUREMENT CONTROL message. In this message, SS commands the establishment of a traffic volume measurement and reporting task, but IE "Traffic volume reporting quantity" is omitted in this message. The UE shall not establish the traffic volume measurement. It shall send a MEASUREMENT CONTROL FAILURE message to report that a "configuration incomplete" error has been detected.

#### Expected Sequence

| Step | Direction |    | Message                     | Comment                                                                                                                          |
|------|-----------|----|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------|

| DPCH compressed mode status info                       | Not Present                          |

## MEASUREMENT CONTROL FAILURE (Step 7)

| Information Element        | Value/Remark                                                                                          |
|----------------------------|-------------------------------------------------------------------------------------------------------|
| RRC transaction identifier | Check if it is set to the same value of the same IE in the MEASUREMENT CONTROL message sent in Step 6 |
| Failure cause              | Check to see if set to "incomplete configuration"                                                     |

## MEASUREMENT CONTROL (Step 8)

| Information Element           | Value/Remark                  |
|-------------------------------|-------------------------------|
| Measurement identity          | 16                            |
| Measurement command           | Setup                         |
| → CHOICE measurement type     | Quality measurement           |
| → Quality reporting quantity  | Not present                   |
| → Reporting criteria          | Periodical reporting criteria |
| → Reporting amount            | Infinity                      |
| → Reporting interval          | 64 sec                        |
| Measurement reporting mode    |                               |
| → Transfer Mode               | Acknowledged mode             |
| → Periodical or event trigger | Periodic                      |
| Additional measurement list   | Not Present                   |
| DPCH compressed mode status   | Not Present                   |

## MEASUREMENT CONTROL FAILURE (Step 9)

| Information Element        | Value/Remark                                                                                          |
|----------------------------|-------------------------------------------------------------------------------------------------------|
| RRC transaction identifier | Check if it is set to the same value of the same IE in the MEASUREMENT CONTROL message sent in Step 8 |
| Failure cause              | Check to see if set to "incomplete configuration"                                                     |

## MEASUREMENT CONTROL (Step 10)

| Information Element                | Value/Remark                  |
|------------------------------------|-------------------------------|
| Measurement Identity               | 1                             |
| Measurement Command                | Setup                         |
| CHOICE measurement type            | UE internal measurement       |
| → UE internal measurement quantity | Not present                   |
| → UE internal reporting quantity   |                               |
| → UE Transmitted Power             | TRUE                          |
| → CHOICE mode                      | FDD                           |
| → UE Rx-Tx time difference         | FALSE                         |
| → CHOICE report criteria           | Periodical reporting criteria |
| → Amount of reporting              | Infinity                      |
| → Reporting interval               | 1000 msec                     |
| Measurement Reporting Mode         | Not Present                   |
| Additional measurements list       | Not Present                   |
| DPCH compressed mode status        | Not Present                   |

## MEASUREMENT CONTROL FAILURE (Step 11)

| Information Element        | Value/Remark                                                                                           |
|----------------------------|--------------------------------------------------------------------------------------------------------|
| RRC transaction identifier | Check if it is set to the same value of the same IE in the MEASUREMENT CONTROL message sent in Step 10 |
| Failure cause              | Check to see if set to "incomplete configuration"                                                      |

## MEASUREMENT CONTROL (Step 12)

| Information Element                | Value/Remark                  |
|------------------------------------|-------------------------------|
| Measurement Identity               | 1                             |
| Measurement Command                | Setup                         |
| CHOICE measurement type            | UE internal measurement       |
| → UE internal measurement quantity |                               |
| → CHOICE mode                      | FDD                           |
| → Measurement quantity             | UE Transmitted Power          |
| → Filter Coefficient               | 0                             |
| → UE internal reporting quantity   | Not present                   |
| → CHOICE report criteria           | Periodical reporting criteria |
| → Amount of reporting              | Infinity                      |
| → Reporting interval               | 1000 msec                     |
| Measurement Reporting Mode         | Not Present                   |
| Additional measurements list       | Not Present                   |
| DPCH compressed mode status        | Not Present                   |

## MEASUREMENT CONTROL FAILURE (Step 13)

| Information Element        | Value/Remark                                                                                           |
|----------------------------|--------------------------------------------------------------------------------------------------------|
| RRC transaction identifier | Check if it is set to the same value of the same IE in the MEASUREMENT CONTROL message sent in Step 12 |
| Failure cause              | Check to see if set to "incomplete configuration"                                                      |

## MEASUREMENT CONTROL (Step 14)

| Information Element                      | Value/Remark                  |
|------------------------------------------|-------------------------------|
| Measurement Identity                     | 1                             |
| Measurement Command                      | Setup                         |
| → CHOICE measurement type                | Traffic Volume Measurement    |
| → Traffic volume measurement object list | Not Present                   |
| → Traffic volume measurement quantity    | Not present                   |
| → Traffic volume reporting quantity      |                               |
| → RB buffer payload                      | True                          |
| → RB buffer payload average              | False                         |
| → RB buffer payload variance             | False                         |
| → Measurement validity                   | Not Present                   |

|----------------------------|--------------------------------------------------------------------------------------------------------|
| RRC transaction identifier | Check if it is set to the same value of the same IE in the MEASUREMENT CONTROL message sent in Step 16 |
| Failure cause              | Check to see if set to "incomplete configuration"                                                      |

NOTE: For the MEASUREMENT CONTROL message in step 4, cell 4 is signalled to be added as a new cell into the UE's inter-frequency cell list. However, SS does not need to transmit cell 4 in the downlink, as the UE is not expected to perform measurement and reporting for this cell.

**8.4.1.15.5 Test Requirement**

After step 2, 4, 6, 8, 10, 12, 14 and step 16, the UE shall transmit MEASUREMENT CONTROL FAILURE message, stating the IE "failure-cause" as "incomplete configuration". The UE shall not transmit any MEASUREMENT REPORT messages during the execution of this test case.

**8.4.1.16 Measurement Control and Report: Traffic volume measurement for transition from idle mode to CELL\_FACH state****8.4.1.16.1 Definition****8.4.1.16.2 Conformance requirement**

Upon transition from idle mode to CELL\_FACH state, the UE shall store the measurement control information from the IE "Traffic volume measurements system information" received in System Information Block type 11 or System Information Block type 12. UE shall begin traffic volume measurement reporting according to the assigned information.

**Reference**

3GPP TS 25.331 clause 8.4.1.9.4

**8.4.1.16.3 Test Purpose**

To confirm that after a state transition from idle mode to CELL\_FACH state, the UE shall begin a traffic volume type measurement, as specified in System Information Block type 11 or 12 messages on BCCH. To confirm that in CELL\_FACH state, the UE shall send a MEASUREMENT REPORT message when reporting criteria is satisfied. During CELL\_FACH state, if the UE receives a MEASUREMENT CONTROL message, it shall perform the measurement and reporting tasks based on the MEASUREMENT CONTROL message received.

#### 8.4.1.16.4 Method of test

##### Initial Condition

System Simulator: 1cell

UE: "Registered idle mode on CS" (state 2) or "Registered idle mode on PS" (state 3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE. If the UE supports both CS and PS domains, the initial UE state shall be "Registered idle mode on CS/PS" (state 7).

##### Test Procedure

The UE is initially in idle mode. The System Information Block type 11 message is modified with respect to the default settings to request UE to perform traffic volume measurements. Key measurement parameters are as follows: measurement quantity = "RLC Buffer Payload", report criteria = "periodic reporting criteria", reporting interval = "6 seconds", reporting amount = 'infinity'. The System Information type 12 message is not broadcasted.

SS prompts the operator to make an outgoing call for one of the traffic classes supported by the UE. The UE shall transmit a RRC CONNECTION REQUEST message on the uplink CCCH, SS replies with RRC CONNECTION SETUP message and allocates PRACH and S-CCPCH physical channels for uplink and downlink usage. UE shall then enter CELL\_FACH state.

UE shall begin traffic volume measurements, and shall send MEASUREMENT REPORT message after completing first measurement. UE shall send second MEASUREMENT REPORT message 6 seconds after first MEASUREMENT REPORT message.

SS sends MEASUREMENT CONTROL message to the UE. This message overwrites measurement information saved from System information type 11. Key measurement parameters are as follow: measurement type = "traffic volume measurement", measurement quantity = "RLC Buffer Payload", report criteria = "Event triggered, event 4B: Transport Channel Traffic Volume becomes smaller than an absolute threshold", Time to trigger = "5 seconds", pending time after trigger = "16 seconds", "reporting threshold = '4K'". Since there is no uplink traffic, UE shall send MEASUREMENT REPORT message after 5 seconds (time to trigger interval).

##### Expected Sequence

| Step | Direction |    | Message                          | Comment                                                                                                                                                               |
|------|-----------|----|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                  |                                                                                                                                                                       |
| 1    |           | ←  | System Information Block type 11 | The UE is idle mode and camped onto cell 1. System Information Block type 11 to be transmitted is different from the default settings (see specific message contents) |
| 2    |           |    |                                  | SS prompts the test operator to make an outgoing call.                                                                                                                |
| 3    |           | →  | RRC CONNECTION REQUEST           |                                                                                                                                                                       |
| 4    |           | ←  | RRC CONNECTION SETUP             | SS allocates common physical channels to UE.                                                                                                                          |
| 5    |           | →  | RRC CONNECTION COMPLETE          | UE shall enter CELL_FACH state, and transmit this message to acknowledge the RRC CONNECTION SETUP message.                                                            |
| 6    |           | →  | MEASUREMENT REPORT               |                                                                                                                                                                       |
| 7    |           | →  | MEASUREMENT REPORT               | Time difference between earlier and this MEASUREMENT REPORT message should be 6 Seconds.                                                                              |

|    |   |                     |                                                                                                       |

| → UL transport channel causing event | Rach Null                            |
| → Traffic volume event identity      | 4B                                   |

## 8.4.1.16.5 Test Requirement

After step 5 the UE shall send MEASUREMENT REPORT messages on the uplink DCCH containing RLC buffer payload information for all SRBs. After 6 seconds UE shall send second MEASUREMENT REPORT messages containing RLC buffer payload information for all SRBs.

After step 8 the UE shall overwrite measurement information received from system information type 11 with measurement information in MEASUREMENT CONTROL message. The UE shall not send MEASUREMENT REPORT message within time to trigger interval. After step 9 the UE shall transmit MEASUREMENT REPORT messages with event identity 4B.

## 8.4.1.17 Measurement Control and Report: Traffic volume measurement for transition from idle mode to CELL\_DCH state

## 8.4.1.17.1 Definition

## 8.4.1.17.2 Conformance requirement

Upon transition from idle mode to CELL\_DCH state, the UE shall begin a traffic volume type measurement, assigned in System Information Block type 11 or System Information Block type 12.

## Reference

3GPP TS 25.331 clause 8.4.1.8.4

### 8.4.1.17.3 Test Purpose

To confirm that after a state transition from idle mode to CELL\_DCH state, the UE begin a traffic volume type measurement, as specified in System Information Block type 11 or 12 messages on BCCH. When entering CELL\_DCH state, the UE shall send a MEASUREMENT REPORT message when reporting criteria is satisfied. During CELL\_DCH state, if the UE receives a MEASUREMENT CONTROL message, it shall perform the measurement and reporting tasks based on the MEASUREMENT CONTROL message received.

### 8.4.1.17.4 Method of test

#### Initial Condition

System Simulator: 1cell

UE: "Registered idle mode on CS" (state 2) or "Registered idle mode on PS" (state 3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE. If the UE supports both CS and PS domains, the initial UE state shall be "Registered idle mode on CS/PS" (state 7).

#### Test Procedure

The UE is initially in idle mode. The System Information Block type 11 message is modified with respect to the default settings to request UE to perform traffic volume measurements. Key measurement parameters are as follows: measurement quantity = "Average RLC Buffer Payload", report criteria = "Event triggered, event 4B", reporting threshold = "8K", report transfer mode = "Unacknowledged mode". The System Information type 12 message is not broadcasted.

SS prompts the operator to make an outgoing call for one of the traffic classes supported by the UE. Dedicated resources are allocated to the UE during RRC connection establishment procedure.

UE shall begin traffic volume measurements after entering in CELL\_DCH state. The UE shall send MEASUREMENT REPORT message because uplink traffic is below threshold.

SS sends MEASUREMENT CONTROL message to the UE. This message reconfigures measurement information saved from System information type 11. Key measurement parameters are as follow: measurement type = "traffic volume measurement", measurement quantity = "RLC Buffer Payload", report criteria = "Periodic reporting criteria", reporting interval = "8 seconds", reporting amount = "8". The UE shall periodically send MEASUREMENT REPORT message to report RLC Buffer Payload for each RB.

SS sends MEASUREMENT CONTROL message to release traffic volume measurement. UE shall not send measurement report after receiving this message.

#### Expected Sequence

| Step | Direction |    | Message                          | Comment                                                                                                                                                               |
|------|-----------|----|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                  |                                                                                                                                                                       |
| 1    |           | ←  | System Information Block type 11 | The UE is idle mode and camped onto cell 1. System Information Block type 11 to be transmitted is different from the default settings (see specific message contents) |
| 2    |           |    |                                  | SS prompts the test operator to make an outgoing call.                                                                                                                |
| 3    |           | →  | RRC CONNECTION REQUEST           |                                                                                                                                                                       |
| 4    |           | ←  | RRC CONNECTION SETUP             | SS allocates dedicated physical channels to UE.                                                                                                                       |
| 5    |           | →  | RRC CONNECTION COMPLETE          | UE shall enter CELL_DCH state.                                                                                                                                        |

|    |   |                     |                                                                                          |
|----|---|---------------------|------------------------------------------------------------------------------------------|
| 6  | → | MEASUREMENT REPORT  | Event 4B is triggered. This message should come on RB1.                                  |
| 7  | ← | MEASUREMENT CONTROL | Periodic Traffic volume measurement reporting is requested.                              |
| 8  | → | MEASUREMENT REPORT  | This message should come on RB2.                                                         |
| 9  | → | MEASUREMENT REPORT  | Time difference between earlier and this MEASUREMENT REPORT message should be 8 Seconds. |
| 10 | ← | MEASUREMENT CONTROL | Release traffic volume measurement.                                                      |
| 11 |   |                     | Wait for 8 Seconds to confirm that UE does not send measurement report message.          |

| DPCH compressed mode status | Not Present  |

**8.4.1.17.5 — Test Requirement**

After step 5, due to triggering of event 4B, the UE shall send MEASUREMENT REPORT message using unacknowledged mode of RLC. After step 7, UE shall send MEASUREMENT REPORT message using Acknowledged mode of RLC. After 8 seconds UE shall send second MEASUREMENT REPORT message. After step 10, the UE shall not send MEASUREMENT REPORT message.

**8.4.1.18 — Measurement Control and Report: Traffic volume measurement for transition from CELL\_FACH state to CELL\_DCH state****8.4.1.18.1 — Definition****8.4.1.18.2 — Conformance requirement**

Upon transition from CELL\_FACH to CELL\_DCH state, the UE shall:

- retrieve each set of measurement control information of measurement type "traffic volume" stored;
- if the optional IE "measurement validity" for this measurement has not been included;
- delete the measurement;

- if the IE "measurement validity" for the measurement has been included, and the IE "UE state" has been assigned to value "all states except CELL\_DCH":
  - stop measurement reporting; and
  - save the measurement to be used after the next transition to CELL\_FACH state;
- if the IE "measurement validity" for the measurement has been included, and the IE "UE state" has been assigned to value "all states":
  - continue measurement reporting;
- if the IE "measurement validity" has been included and the IE "UE state" has been assigned to value "CELL\_DCH":
  - resume this measurement and associated reporting;
- if no traffic volume type measurement has been assigned to the UE with a MEASUREMENT CONTROL message when transiting to CELL\_DCH state:
  - continue an ongoing traffic volume type measurement, assigned in System Information Block type 11 or System Information Block type 12.

## Reference

3GPP TS 25.331 clause 8.4.1.7.4

### 8.4.1.18.3 ————— Test Purpose

To confirm that the UE performs traffic volume measurements and the associated reporting when it enters CELL\_DCH state from CELL\_FACH state, and that such measurement contexts (and optionally, the reporting context) valid for CELL\_DCH state have been previously stored.

To confirm that the UE shall continue to perform traffic volume measurement listed in the System Information Block type 11 or 12 messages, if no previously assigned measurements are present. The UE shall transmit MEASUREMENT REPORT messages if reporting conditions stated in System Information Block type 11 or 12 messages have been satisfied.

### 8.4.1.18.4 ————— Method of test

#### Initial Condition

System Simulator: 1 cell

UE: PS-DCCH+DTCH\_FACH (state 6-11) as specified in clause 7.4 of TS 34.108

#### Test Procedure

Initially the UE is in CELL\_FACH state. MEASUREMENT CONTROL message is sent to the UE to establish traffic volume measurement context with optional IE "measurement validity" is not present. The UE shall perform measurement and reporting as assigned in MEASUREMENT CONTROL message. RADIO BEARER RECONFIGURATION procedure is used to take the UE from CELL\_FACH state to CELL\_DCH state. While entering CELL\_DCH state from CELL\_FACH state, the UE shall delete traffic volume measurement contexts if optional IE "measurement validity" is not present. So, in CELL\_DCH state UE shall not perform traffic volume measurement and reporting. UE is taken to the CELL\_FACH state from CELL\_DCH state using RADIO BEARER RECONFIGURATION procedure. The UE shall not send MEASUREMENT REPORT message as measurement context is already deleted.

Similarly behavior of the UE when moved from CELL\_FACH state to CELL\_DCH state and assigned traffic volume measurement context is present with IE "measurement validity" is set to "All But CELL\_DCH state" or "CELL\_DCH state" or "All states" is tested.

When the UE is in CELL\_FACH state, System Information is modified to assign traffic volume measurement and reporting to the UE. No previously assigned traffic volume measurement contexts are present in the UE. The UE is taken to CELL\_DCH state from CELL\_FACH state using RADIO BEARER RECONFIGURATION procedure. In CELL\_DCH state the UE shall continue traffic volume measurement and reporting as assigned in System Information. Traffic volume measurement and reporting is released by sending MEASUREMENT CONTROL message.

#### Expected Sequence

| Step | Direction |    | Message                               | Comment                                                                                                                                       |

**MEASUREMENT REPORT (Step 34, and 37)**

The contents of this message are identical to MEASUREMENT REPORT (Step 2) message with the following exceptions:

| Information Element  | Value/Remarks |
|----------------------|---------------|
| Measurement identity | 5             |

### MEASUREMENT CONTROL (Step 38)

The contents of this message are identical to MEASUREMENT CONTROL (Step 14) message with the following exceptions:

| Information Element  | Value/Remark |
|----------------------|--------------|
| Measurement Identity | 5            |

#### 8.4.1.18.5 ——— Test Requirement

The UE shall send MEASUREMENT REPORT message in steps 21, 29 and 37. The UE shall not send MEASUREMENT REPORT message in steps 5, 8, and 13.

### ~~8.4.1.19 ——— Measurement Control and Report: Traffic volume measurement for transition from CELL\_DCH to CELL\_FACH state~~

#### ~~8.4.1.19.1 ——— Definition~~

#### ~~8.4.1.19.2 ——— Conformance requirement~~

Upon transition from CELL\_DCH to CELL\_FACH state, the UE shall:

- retrieve each set of measurement control information of measurement type "traffic volume" stored in the UE; and
- if the optional IE "measurement validity" for this measurement has not been included:
  - delete the associated measurement;
- if the IE "measurement validity" for the measurement has been included, and the IE "UE state" has been assigned to value "CELL\_DCH":
  - stop measurement reporting;
  - save the associated measurement to be used after the next transition to CELL\_DCH state;
- if the IE "measurement validity" for the measurement has been included, and the IE "UE state" has been assigned to value "all states":
  - continue measurement reporting;
- if the IE "measurement validity" has been included and the IE "UE state" has been assigned to value "all states except CELL\_DCH":
  - resume this measurement and associated reporting;
- if no traffic volume type measurements applicable to CELL\_FACH states are stored in the UE:
  - store the measurement control information from the IE "Traffic volume measurement system information" received in System Information Block type 12 or System Information Block type 11;
  - begin traffic volume measurement reporting according to the assigned information.

#### ~~8.4.1.19.3 ——— Test Purpose~~

The UE shall performs traffic volume measurements and the associated reporting when it enters CELL\_FACH state from CELL\_DCH state, and that such measurement contexts (and optionally, the reporting context) valid for CELL\_FACH state have been previously stored.

The UE shall perform traffic volume measurement listed in the System Information Block type 11 or 12 messages, if no previously assigned measurements are present. The UE shall transmit MEASUREMENT REPORT messages if reporting conditions has been satisfied.

## Reference

3GPP TS 25.331 clause 8.4.1.6.6

## 8.4.1.19.4 Method of test

### Initial Condition

System Simulator: 1 cell

UE: PS-DCH+DTCH\_DCH (state 6-10) as specified in clause 7.4 of TS 34.108

### Test Procedure

Initially the UE is in CELL\_DCH state. MEASUREMENT CONTROL message is sent to the UE to establish traffic volume measurement context with optional IE "measurement validity" is not present. The UE shall perform measurement and reporting as assigned in MEASUREMENT CONTROL message. RADIO BEARER RECONFIGURATION procedure is used to take the UE from CELL\_DCH state to CELL\_FACH state. While entering CELL\_FACH state from CELL\_DCH state, the UE shall delete traffic volume measurement contexts if optional IE "measurement validity" is not present. So, in CELL\_FACH state UE shall not perform traffic volume measurement and reporting. UE is taken to the CELL\_DCH state from CELL\_FACH state using RADIO BEARER RECONFIGURATION procedure. The UE shall not send MEASUREMENT REPORT message as measurement context is already deleted.

Similarly behavior of the UE when moved from CELL\_DCH state to CELL\_FACH state and assigned traffic volume measurement context is present with IE "measurement validity" is set to "All But CELL\_DCH state" or "CELL\_DCH state" or "All states" is tested.

When the UE is in CELL\_DCH state, System Information is modified to assign traffic volume measurement and reporting to the UE. No previously assigned traffic volume measurement contexts are present in the UE. The UE is taken to CELL\_FACH state from CELL\_DCH state using RADIO BEARER RECONFIGURATION procedure. In CELL\_FACH state the UE shall perform traffic volume measurement and reporting as assigned in System Information. Traffic volume measurement and reporting is released by sending MEASUREMENT CONTROL message.

## MEASUREMENT REPORT (Step 36)

The contents of this message are identical to MEASUREMENT REPORT (Step 2) message with the following exceptions:

| Information Element  | Value/Remarks |
|----------------------|---------------|
| Measurement identity | 5             |

## MEASUREMENT CONTROL (Step 37)

The contents of this message are identical to MEASUREMENT CONTROL (Step 14) message with the following exceptions:

| Information Element  | Value/Remark |
|----------------------|--------------|
| Measurement Identity | 5            |

## 8.4.1.19.5 ——— Test Requirement

The UE shall send MEASUREMENT REPORT message in steps 13, 29 and 36. The UE shall not send MEASUREMENT REPORT message in steps 5, 8, and 21.

### ~~8.4.1.20 Measurement Control and Report: Traffic volume measurement in CELL\_PCH state~~

#### ~~8.4.1.20.1 Definition~~

#### ~~8.4.1.20.2 Conformance requirement~~

~~In CELL\_PCH state, when the reporting criteria is fulfilled for any traffic volume measurement which is being performed in the UE, the UE shall first perform the cell update procedure with the cause "uplink data transmission", in order to transit to CELL\_FACH state and then transmit a MEASUREMENT REPORT message on the uplink DCCH~~

#### ~~8.4.1.20.3 Test Purpose~~

~~To confirm that in CELL\_PCH state, UE performs assigned traffic volume measurement. When reporting criteria for ongoing traffic volume measurement is fulfilled, the UE shall first perform cell update procedure and then transmit MEASUREMENT REPORT message.~~

#### ~~Reference~~

~~3GPP TS 25.331 clause 8.4.2.2~~

#### ~~8.4.1.20.4 Method of test~~

#### ~~Initial Condition~~

~~System Simulator: 1 cell~~

~~UE: PS-DCCH+DTCH\_DCH (state 6-10) as specified in clause 7.4 of TS 34.108~~

#### ~~Test Procedure~~

~~Initially the UE is in CELL\_DCH state. System Information block type 12 message is modified to assign traffic volume measurement and reporting. RADIO BEARER RECONFIGURATION procedure is used to take UE from CELL\_DCH state to CELL\_PCH state. While entering in CELL\_PCH state from CELL\_DCH state UE should start traffic volume measurement as assigned in System Information. When reporting criteria for traffic volume measurement is satisfied the UE shall change state to CELL\_FACH and perform CELL UPDATE procedure. After successful completion of CELL UPDATE procedure, UE shall transmit MEASUREMENT REPORT message.~~

| — RLC buffer payload variance        | Check to see if this IE is present   |
| Measured results on RACH             | Check to see if this IE is absent    |
| Additional measured results          | Check to see if this IE is absent    |
| Event results                        | Check to see if this IE is absent    |

#### 8.4.1.20.5 — Test Requirement

The UE shall send CELL UPDATE message with cause "Uplink data transfer" in step 4 and MEASUREMENT REPORT message in 6.

### ~~8.4.1.21 Measurement Control and Report: Traffic volume measurement in URA\_PCH state~~

#### ~~8.4.1.21.1 Definition~~

#### ~~8.4.1.21.2 Conformance requirement~~

~~In URA\_PCH state, when the reporting criteria is fulfilled for any traffic volume measurement which is being performed in the UE, the UE shall first perform the cell update procedure with the cause "uplink data transmission", in order to transit to CELL\_FACH state and then transmit a MEASUREMENT REPORT message on the uplink DCCH~~

#### ~~8.4.1.21.3 Test Purpose~~

~~To confirm that in URA\_PCH state, UE performs assigned traffic volume measurement. When reporting criteria for ongoing traffic volume measurement is fulfilled, the UE shall first perform cell update procedure and then transmit MEASUREMENT REPORT message.~~

#### ~~Reference~~

~~3GPP TS 25.331 clause 8.4.2.2~~

#### ~~8.4.1.21.4 Method of test~~

#### ~~Initial Condition~~

~~System Simulator: 1 cell~~

~~UE: PS-DCCH+DTCH\_DCH (state 6-10) as specified in clause 7.4 of TS 34.108~~

#### ~~Test Procedure~~

~~Initially the UE is in CELL\_DCH state. MEASUREMENT CONTROL message is sent to UE to assign traffic volume measurement and reporting to be performed in all states except CELL\_DCH. The UE is requested to perform periodic reporting of measurements with IE "Reporting amount" is set to 1. RADIO BEARER RECONFIGURATION procedure is used to take UE from CELL\_DCH state to URA\_PCH state. While entering in URA\_PCH state from CELL\_DCH state UE should start traffic volume measurement as assigned by MEASUREMENT CONTROL message. When reporting criteria for traffic volume measurement is satisfied the UE shall change state to CELL\_FACH and perform CELL UPDATE procedure. After successful completion of CELL UPDATE procedure, UE shall transmit MEASUREMENT REPORT message. The UE shall not send second MEASUREMENT REPORT message after reporting interval, because IE "Reporting amount" in MEASUREMENT CONTROL message is set to 1.~~

| Measured results on RACH             | Check to see if this IE is absent    |
| Additional measured results          | Check to see if this IE is absent    |
| Event results                        | Check to see if this IE is absent    |

**8.4.1.21.5 — Test Requirement**

The UE shall send CELL UPDATE message with cause "Uplink data transfer" in step 4 and MEASUREMENT REPORT message in 6. The UE shall not send MEASUREMENT REPORT message in step 7.

**8.4.1.22 — Measurement Control and Report: Quality measurements****8.4.1.22.1 — Definition****8.4.1.22.2 — Conformance requirement**

In CELL\_DCH state, the UE shall send MEASUREMENT REPORT message when reporting criteria is fulfilled for any ongoing quality measurements.

## Reference

3GPP TS 25.331 clause 8.4

8.4.1.22.3 ~~Test Purpose~~

To confirm that the UE performs quality measurement as specified in MEASUREMENT CONTROL message received. In CELL\_DCH state, the UE shall send MEASUREMENT REPORT message when the reporting criteria is fulfilled for any ongoing quality measurement.

8.4.1.22.4 ~~Method of test~~

## Initial Condition

System Simulator: 1 cell

UE: CELL\_DCH state (state 6-1 or state 6-3) as specified in clause 7.4 of TS 34.108, depending on the CN domain(s) supported by the UE

## Test Procedure

The UE is in CELL\_DCH state. MEASUREMENT CONTROL message is sent to UE to assign quality measurement and reporting. As assigned in MEASUREMENT CONTROL message, the UE shall periodically send MEASUREMENT REPORT message reporting BLER of downlink transport channel(s).

## Expected Sequence

| Step | Direction |    | Message             | Comment                                                           |
|------|-----------|----|---------------------|-------------------------------------------------------------------|
|      | UE        | SS |                     |                                                                   |
| 1    |           | ←  | MEASUREMENT CONTROL | The UE is requested to perform "Quality measurements"             |
| 2    |           | →  | MEASUREMENT REPORT  |                                                                   |
| 3    |           | →  | MEASUREMENT REPORT  | UE shall send second MEASUREMENT REPORT message after 64 seconds. |

## Specific Message Content

## MEASUREMENT CONTROL (Step 1)

| Information Element           | Value/Remark                  |

| Measurement reporting mode    |                               |
| → Transfer Mode               | Acknowledged mode             |
| → Periodical or event trigger | Periodic                      |
| Additional measurement list   | Not Present                   |
| DPCH compressed mode status   | Not Present                   |

## MEASUREMENT REPORT (Step 2,3)

| Information Element             | Value/Remarks                      |
|---------------------------------|------------------------------------|
| Measurement identity            | 16                                 |
| Measured Results                | Quality measurement                |
| → CHOICE measurement            |                                    |
| → BLER measurement results list | 10                                 |
| → Transport channel identity    | Check to see if this IE is present |
| → DL transport channel BLER     | fd: Null                           |
| → Mode specific info            | Check to see if this IE is absent  |
| Measured results on RACH        | Check to see if this IE is absent  |
| Additional measured results     | Check to see if this IE is absent  |
| Event results                   | Check to see if this IE is absent  |

## 8.4.1.22.5 Test Requirement

In step 2 and 3, the UE shall send MEASUREMENT REPORT message to report BLER for downlink DCH transport channel.

## 8.4.1.23 Measurement Control and Report: Intra-frequency measurement for events 1C and 1D

## 8.4.1.23.1 Definition

## 8.4.1.23.2 Conformance requirement

1. When event 1C is configured in the UE, the UE shall:

- if "Measurement quantity" is "pathloss" and Equation 1 below is fulfilled for a primary CPICH, or if "Measurement quantity" is "CPICH Ec/N0" or "CPICH RSCP", and Equation 2 below is fulfilled for a primary CPICH:
- if the equations have been fulfilled during the time "Time to trigger", and if the primary CPICH that is better is not included in the active set but the other primary CPICH is any of the primary CPICHs included in the active set, and if that primary CPICH is not included in the "cells triggered" in the variable TRIGGERED\_1C\_EVENTS:
- include that primary CPICH in the "cells triggered" in the variable TRIGGERED\_1C\_EVENTS;
- if the value of "Replacement activation threshold" for this event is lower than the current number of cells in the active set or equal to 0:
- if "Reporting interval" for this event is not equal to 0:
  - start a timer for that primary CPICH with the value of "Reporting interval" for this event;
  - set "sent reports" for that primary CPICH in the variable TRIGGERED\_1C\_EVENTS;
  - send a measurement report with IEs set as below:
    - in "intra-frequency event results": "Intrafrequency event identity" to "1c" and the first entry in "cell measurement event results" to the CPICH info of the primary CPICH not in the active set that triggered the report; and
    - the second entry in "cell measurement event results" to the CPICH info of the primary CPICH in the active set that now is worse than the new primary CPICH and has the best measured value (lowest measured result for pathloss and highest measured result for other measurements); and

- the rest of the entries to other primary CPICHs that are now worse than this new primary CPICH in the order of their measured value;
- "measured results" and possible "additional measured results" according to 8.4.2;

2. When event 1D is configured in the UE, the UE shall:

- if "Measurement quantity" is "pathloss" and Equation 1 below is fulfilled for a primary CPICH that is not stored in "Best cell" in variable BEST\_CELL\_1D\_EVENT, or if "Measurement quantity" is "CPICH Ec/N0" or "CPICH RSCP", and Equation 2 below is fulfilled for a primary CPICH that is not stored in "Best cell" in variable BEST\_CELL\_1D\_EVENT:
- if the equations have been fulfilled during the time "Time to trigger":
  - set "best cell" in the variable BEST\_CELL\_1D\_EVENT to that primary CPICH that triggered the event;
  - send a measurement report with IEs set as below:
    - in "intra-frequency event results"; "Intrafrequency event identity" to "1d" and "cell measurement event results" to the CPICH info of the primary CPICH that triggered the report;
    - "measured results" and possible "additional measured results" according to 8.4.2;

## Reference

3GPP TS 25.331 clause 14.1.2.3, 14.1.2.4.

### 8.4.1.23.3 ————— Test Purpose

- 1.A To confirm that the UE sends MEASUREMENT REPORT message if event 1C is configured, and number of cells in active set is greater than or equal to 'Replacement activation threshold' parameter, and if monitored or detected primary CPICH on same frequency becomes better than a primary CPICH in active set.
- 1.B To confirm that the UE does not send MEASUREMENT REPORT message indicating event 1C if number of cells in active set is less than 'Replacement activation threshold' parameter, and if monitored or detected primary CPICH on same frequency becomes better than a primary CPICH in active set.
- 1.C To confirm that the UE stops periodic reporting of event 1C if the cell that triggered event 1C is added into active set.
- 2. To confirm that the UE sends MEASUREMENT REPORT message if event 1D is configured and intra-frequency measurement indicates change in best cell.

### 8.4.1.23.4 ————— Method of test

#### Initial Condition

System Simulator: 3 cells—The initial configurations of the 3 cells in the SS shall follow the values indicated in the column marked "T0" in table 8.4.1.23-1. The table is found in "Test Procedure" clause.

UE: CS-DCCH\_DCH\_Initial (State 6-1) or PS-DCCH\_DCH\_Initial (State 6-3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

#### Test Procedure

Table 8.4.1.23-1 illustrates the downlink power to be applied for the 3 cells at various time instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1" and "T2" are to be applied subsequently. The exact instants on which these values shall be applied are described in the text in this clause.

**Table 8.4.1.23-1**

| Parameter              | Unit | Cell 1 |     |     | Cell 2 |     |              | Cell 3       |     |     |
|------------------------|------|--------|-----|-----|--------|-----|--------------|--------------|-----|-----|
|                        |      | T0     | T1  | T2  | T0     | T1  | T2           | T0           | T1  | T2  |
| UTRA RF Channel Number |      | Ch. 1  |     |     | Ch. 1  |     |              | Ch. 1        |     |     |
| CPICH Ec               | dBm  | -60    | -60 | -66 | -70    | -70 | Switched off | Switched off | -70 | -60 |

The UE is initially in CELL\_DCH state of cell 1. SS then performs a soft handover procedure by sending ACTIVE SET UPDATE message on the downlink DCCH. The UE shall reply with an ACTIVE SET UPDATE COMPLETE message on the uplink DCCH, and include cell 2 to the active set when the activation time specified has elapsed.

SS then ask the UE to perform Intra-frequency measurement and report event 1C and event 1D. In MEASUREMENT CONTROL message, IE 'Replacement activation threshold' is set to 3 and IE 'Cell individual offset' is set to +6 dBm for Cell 3. SS configures itself according to the values in columns "T1" shown above. Cell 3 becomes better than Cell 2 that is in active set of the UE, due to parameter 'Cell Individual offset' for Cell 3. However the UE shall not send MEASUREMENT REPORT message indicating event 1C because number of cells in active set is less than parameter 'Replacement Activation Threshold'.

SS then sends MEASUREMENT CONTROL message to the UE to modify earlier configured intra-frequency measurement. Now, IE 'Replacement activation threshold' is set to 1. MEASUREMENT CONTROL message contains only those IEs that are modified and the UE shall continue to use current values of parameters that are not modified. The UE sends MEASUREMENT REPORT message reporting event 1C, monitored Cell 3 is better than Cell 2 that is in active set. The UE sends second MEASUREMENT REPORT message reporting event 1C after 4 seconds, equals to parameter 'Reporting interval'.

SS then performs soft handover procedure by sending ACTIVE SET UPDATE message on the downlink DCCH. In this message SS commands UE to add Cell 3 and remove Cell 2 from active set. The UE shall reply with an ACTIVE SET UPDATE COMPLETE message. The UE shall also stop periodic reporting of event 1C because the Cell that triggered it is added into active set. SS then configures itself according to the values in columns "T2" shown above. This triggers event 1D and the UE sends MEASUREMENT REPORT message indicating Cell 3 as a best cell.

## Expected Sequence

| Step | Direction |    | Message                    | Comment                                                                                                |
|------|-----------|----|----------------------------|--------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                            |                                                                                                        |
| 1    |           | ←  | ACTIVE SET UPDATE          | SS command the UE to add Cell 2 in active set.                                                         |
| 2    |           | →  | ACTIVE SET UPDATE COMPLETE |                                                                                                        |
| 3    |           | ←  | MEASUREMENT CONTROL        | Event 1C and 1D are configured. IE "Replacement activation threshold" is set to 3.                     |
| 4    |           |    |                            | SS re-adjusts the downlink transmission power settings according to columns "T1" in table 8.4.1.23-1.  |
| 5    |           |    |                            | Check for 10 seconds, the UE shall not send MEASUREMENT REPORT message.                                |
| 6    |           | ←  | MEASUREMENT CONTROL        | Measurement configured in step 3 is modified to set parameter 'replacement activation threshold' to 1. |
| 7    |           | →  | MEASUREMENT REPORT         | Event 1C is triggered. The UE shall report that Cell 3 is better than Cell 2.                          |
| 8    |           | →  | MEASUREMENT REPORT         | The UE shall send second report after 4 seconds (Reporting interval)                                   |
| 9    |           | ←  | ACTIVE SET UPDATE          | SS command the UE to replace Cell 2 in active set by Cell 3.                                           |
| 10   |           | →  | ACTIVE SET UPDATE COMPLETE |                                                                                                        |
| 11   |           |    |                            | Check for 10 seconds, the UE shall not send MEASUREMENT REPORT message.                                |
| 12   |           |    |                            | SS re-adjusts the downlink transmission power settings according to columns "T2" in table 8.4.1.23-1.  |
| 13   |           | →  | MEASUREMENT REPORT         | The UE shall report event 1D change of best cell                                                       |

## Specific Message Contents

All messages indicated below shall use the same content as described in default message content, with the following exceptions:

## ACTIVE SET UPDATE (Step 1)

| Information Element                          | Value/Remark                                                                    |
|----------------------------------------------|---------------------------------------------------------------------------------|
| Radio link addition information              |                                                                                 |
| → Primary CPICH Info                         |                                                                                 |
| → Primary scrambling code                    | Primary scrambling code of Cell 2                                               |
| → Downlink DPCH info for each RL             |                                                                                 |
| → Primary CPICH usage for channel estimation | P-CPICH may be used.                                                            |
| → DPCH frame offset                          | 0 chips                                                                         |
| → Secondary CPICH info                       | Not present                                                                     |
| → DL channelisation code                     | This IE is repeated for all existing downlink DPCHs allocated to the UE         |
| → Secondary scrambling code                  | Not present                                                                     |
| → Spreading factor                           | Refer to the parameter set in TS 34.108                                         |
| → Code number                                | For each DPCH, assign the same code number in the current code given in cell 1. |
| → Scrambling code change                     | Not present                                                                     |
| → TPC combination index                      | 0                                                                               |
| → SSDT cell identity                         | Not present                                                                     |
| → Close loop timing adjustment mode          | Not present                                                                     |
| → TFCI combining indicator                   | Not present                                                                     |
| → SCCPCH information for FACH                | Not present                                                                     |
| Radio link removal information               | Not present                                                                     |

## MEASUREMENT CONTROL (Step 3)

| Information Element                                    | Value/Remark                                   |
|--------------------------------------------------------|------------------------------------------------|
| Measurement identity                                   | 1                                              |
| Measurement command                                    | Setup                                          |

| → Cell measurement event results |                                   |
| → Primary scrambling code        | Primary scrambling code of Cell 3 |

## 8.4.1.23.5 Test Requirement

- 1.A In steps 7 and 8 the UE shall send MEASUREMENT REPORT message indicating event 1C. IE 'Cell measurement event results' in MEASUREMENT REPORT message shall contain primary scrambling code of Cell 3 and Cell 2 in that order.
- 1.B In step 5 the UE shall not send MEASUREMENT REPORT message.
- 1.C In step 11 the UE shall not send MEASUREMENT REPORT message.
2. In step 13 the UE shall send MEASUREMENT REPORT message indicating event 1D. IE 'Cell measurement event results' in MEASUREMENT REPORT message shall contain primary scrambling code of Cell 3.

## 8.4.1.24 Measurement Control and Report: Inter-frequency measurement for event 2A

## 8.4.1.24.1 Definition

## 8.4.1.24.2 Conformance requirement

- 1.If any of the non-used frequencies quality estimate becomes better than the currently used frequency quality estimate, and event 2A has been ordered by UTRAN then this event shall trigger a report to be sent from the

UE when the hysteresis and time to trigger conditions is fulfilled. The corresponding report contains (at least) the best primary CPICH on the non-used frequency that triggered the event.

## Reference

3GPP TS 25.331 clause 14.2.1.1

### 8.4.1.24.3 Test Purpose

- 1.A To confirm that the UE sends MEASUREMENT REPORT message if event 2A is configured, and if any of the non-used frequencies quality estimate becomes better than the currently used frequency quality estimate.
- 1.B To confirm that the UE does not send MEASUREMENT REPORT message indicating event 2A if hysteresis condition is not fulfilled.
- 1.C To confirm that the UE does not send MEASUREMENT REPORT message indicating event 2A if time to trigger condition is not fulfilled.

### 8.4.1.24.4 Method of test

#### Initial Condition

System Simulator: 2 cells—The initial configurations of the 2 cells in the SS shall follow the values indicated in the column marked "T0" in table 8.4.1.24-1. The table is found in "Test Procedure" clause.

UE: CS-DGCH-DCH\_Initial (State 6-1) or PS-DGCH-DCH\_Initial (State 6-3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

#### Test Procedure

Table 8.4.1.24-1 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1", "T2", "T3", "T4" and "T5" are to be applied subsequently. The exact instants on which these values shall be applied are described in the text in this clause.

**Table 8.4.1.24-1**

| Parameter              | Unit | Cell 1 |     |     |     |     |     | Cell 4 |     |     |     |     |     |
|------------------------|------|--------|-----|-----|-----|-----|-----|--------|-----|-----|-----|-----|-----|
|                        |      | T0     | T1  | T2  | T3  | T4  | T5  | T0     | T1  | T2  | T3  | T4  | T5  |
| UTRA RF Channel Number |      | Ch. 1  |     |     |     |     |     | Ch. 2  |     |     |     |     |     |
| CPICH-Ec               | dBm  | -66    | -66 | -66 | -66 | -66 | -66 | -75    | -60 | -75 | -60 | -75 | -60 |

The UE is initially in CELL\_DCH state of cell 1. SS commands the UE to perform measurements of transmitted power using MEASUREMENT CONTROL message. This measurement is setup to confirm that while sending MEASUREMENT REPORT message, the UE sets IE "Additional measured results" correctly. SS then performs PHYSICAL CHANNEL RECONFIGURATION procedure to activate compressed mode. SS then commands the UE to perform Inter-frequency measurements and report event 2A by sending MEASUREMENT CONTROL message. In MEASUREMENT CONTROL message, IE "Hysteresis" is set to 10 dB and IE "Additional measurement list" is set to id of "UE Internal measurements" configured earlier. SS then configures itself according to the values in columns "T1" shown above. Even though quality estimate for Cell 4 has become better than that of Cell 1, event 2A will not be triggered since hysteresis condition is not fulfilled. SS then configures itself according to the values in columns "T2" shown above.

SS sends MEASUREMENT CONTROL message to modify parameter "Hysteresis" of Inter-frequency measurements to 1 dB. SS then raises power level of Cell 4 according to columns "T3" for short duration (less than 5 seconds), and again configures itself according to columns "T4" shown above. The UE will not send MEASUREMENT REPORT message because time to trigger condition is not fulfilled. SS then configures itself according to the values in columns "T5" shown above. The UE sends MEASUREMENT REPORT message reporting even 2A as well as measurement of transmitted power.

**Important Note:** Duration between time instant "T3" and "T4" (between steps 9 and 10 of expected sequence) must be less than 5 seconds.

#### Expected Sequence

| Step | Direction |    | Message                                   | Comment                                                                                                                                                                       |

## MEASUREMENT REPORT (Step 13)

| Information Element              | Value/Remarks                     |
|----------------------------------|-----------------------------------|
| Measurement identity             | Check to see if set to 2          |
| Measured results                 | Check to see if it is absent      |
| Measured results on RACH         | Check to see if it is absent      |
| Additional measured results      |                                   |
| - Measured results               | UE internal measured results      |
| - UE transmitted power           | Check to see if it is present     |
| - UE RX-TX report entry list     | Check to see if it is absent      |
| Event results                    | Inter-frequency event results,    |
| → Event ID                       | 2A                                |
| → Cell measurement event results |                                   |
| - Frequency info                 | Frequency of Cell 4               |
| - Primary CPICH info             |                                   |
| - Primary scrambling code        | Primary scrambling code of Cell 4 |

## 8.4.1.24.5 Test Requirement

- 1.A In step 13 the UE shall send MEASUREMENT REPORT message indicating event 2A. IE 'Cell measurement event results' in MEASUREMENT REPORT message shall contain frequency information and primary scrambling code of Cell 4.
- 1.B In step 6, the UE shall not send MEASUREMENT REPORT message.
- 1.C In step 11, the UE shall not send MEASUREMENT REPORT message.

### 8.4.1.25 Measurement Control and Report: Inter-frequency measurement for events 2B and 2E

#### 8.4.1.25.1 Definition

#### 8.4.1.25.2 Conformance requirement

1. When event 2E is ordered by UTRAN in a MEASUREMENT CONTROL message the UE shall send a report when the estimated quality of a non-used frequency is below the value of the IE "Threshold non-used frequency" and the hysteresis and time to trigger conditions are fulfilled. The corresponding report contains at least the best primary CPICH on the non-used frequency.
2. When event 2B is ordered by UTRAN in a MEASUREMENT CONTROL message the UE shall send a report when the estimated quality of the currently used frequency is below the value of the IE "Threshold used frequency" and the estimated quality of a non-used frequency is above the value of the IE "Threshold non-used frequency" and the hysteresis and time to trigger conditions are fulfilled. The corresponding report contains at least the best primary CPICH on the non-used frequency that triggered the event.

#### Reference

3GPP TS 25.331 clause 14.2.1.2, 14.2.1.5.

#### 8.4.1.25.3 Test Purpose

1. To confirm that the UE sends MEASUREMENT REPORT message when event 2E is configured and the estimated quality of a non-used frequency is below the value of the IE "Threshold non-used frequency". This MEASUREMENT REPORT message shall contain at least the best primary CPICH on the non-used frequency that triggered the event.
2. To confirm that the UE sends MEASUREMENT REPORT message when event 2B is configured and estimated quality of the currently used frequency is below the value of the IE "Threshold used frequency" and the estimated quality of a non-used frequency is above the value of the IE "Threshold non-used frequency". This MEASUREMENT REPORT message shall contain at least the best primary CPICH on the non-used frequency that triggered the event.

#### 8.4.1.25.4 Method of test

##### Initial Condition

System Simulator: 2 cells—The initial configurations of the 2 cells in the SS shall follow the values indicated in the column marked "T0" in table 8.4.1.24-1. The table is found in "Test Procedure" clause.

UE: CS-DCCH\_DCH\_Initial (State 6-1) or PS-DCCH\_DCH\_Initial (State 6-3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

##### Test Procedure

Table 8.4.1.25-1 illustrates the downlink power to be applied for the 2 cells at various time instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1" and "T2" are to be applied subsequently. The exact instants on which these values shall be applied are described in the text in this clause.

Table 8.4.1.25-1

| Parameter              | Unit | Cell 1 |     |     | Cell 4 |     |     |
|------------------------|------|--------|-----|-----|--------|-----|-----|
|                        |      | T0     | T1  | T2  | T0     | T1  | T2  |
| UTRA RF Channel Number |      | Ch. 1  |     |     | Ch. 2  |     |     |
| CPICH-Ec               | dBm  | -60    | -63 | -74 | -74    | -60 | -60 |

The UE is initially in CELL\_DCH state of cell 1. SS commands the UE to perform Inter-frequency measurements and report event 2B and event 2E by sending MEASUREMENT CONTROL message. SS then performs PHYSICAL CHANNEL RECONFIGURATION procedure to activate compressed mode. Since quality estimate of non-used frequency is below threshold, the UE sends MEASUREMENT REPORT message indicating event 2E. SS then configures itself according to the values in columns "T1" shown above. Now quality estimate of used and non-used frequency is above threshold and hence neither event 2B nor event 2E will be triggered. SS then configures itself according to the values in columns "T2" shown above. Quality estimate for used frequency is now below threshold, while that of non-used frequency is above threshold, the UE sends MEASUREMENT REPORT message to report event 2B.

#### Expected Sequence

| Step | Direction |    | Message                                   | Comment                                                                                                                                                         |
|------|-----------|----|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                           |                                                                                                                                                                 |
| 1    |           | ←  | MEASUREMENT CONTROL                       | SS commands the UE to perform Inter-frequency measurements and to report event 2B and 2E.                                                                       |
| 2    |           | ←  | PHYSICAL CHANNEL RECONFIGURATION          | SS instructs UE to begin compressed mode operation.                                                                                                             |
| 3    |           | →  | PHYSICAL CHANNEL RECONFIGURATION COMPLETE |                                                                                                                                                                 |
| 4    |           | →  | MEASUREMENT REPORT                        | The UE shall report event 2E. Time duration between activation of compressed mode and reception of this message should be at least 5 seconds.                   |
| 5    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T1" in table 8.4.1.25-1.                                                           |
| 6    |           |    |                                           | Check for 10 seconds the UE shall not send measurement report message.                                                                                          |
| 7    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T2" in table 8.4.1.25-1.                                                           |
| 8    |           | →  | MEASUREMENT REPORT                        | The UE shall report event 2B. Time duration between changing power levels according to columns "T2" and reception of this message should be at least 5 seconds. |

#### Specific Message Contents

| - Cell measurement event results        |                                    |
| - Frequency info                        | Frequency of Cell 4                |
| - Primary CPICH info                    |                                    |
| - Primary scrambling code               | Primary scrambling code of Cell 4  |

## 8.4.1.25.5 Test Requirement

1. In step 4 the UE shall send MEASUREMENT REPORT message indicating event 2E. IE "Cell measurement event results" in this message shall contain frequency information and primary scrambling code of Cell 4.
2. In step 8 the UE shall send MEASUREMENT REPORT message indicating event 2B. IE "Cell measurement event results" in this message shall contain frequency information and primary scrambling code of Cell 4.

## 8.4.1.26 Measurement Control and Report: Inter-frequency measurement for events 2D and 2F

## 8.4.1.26.1 Definition

## 8.4.1.26.2 Conformance requirement

1. When event 2F is ordered by UTRAN in a MEASUREMENT CONTROL message the UE shall send a report when the estimated quality of the currently used frequency is above the value of the IE "Threshold-used frequency" and the hysteresis and time to trigger conditions are fulfilled. The corresponding report contains at least the best primary CPICH on the used frequency.
2. When event 2D is ordered by UTRAN in a MEASUREMENT CONTROL message the UE shall send a report when the estimated quality of the currently used frequency is below the value of the IE "Threshold-used frequency" and the hysteresis and time to trigger conditions are fulfilled. The corresponding report contains at least the best primary CPICH on the used frequency.

## Reference

3GPP TS 25.331 clause 14.2.1.4, 14.2.1.6

### 8.4.1.26.3 Test Purpose

1. To confirm that the UE sends MEASUREMENT REPORT message when event 2F is configured and estimated quality of the currently used frequency is above the value of the IE "Threshold used frequency". This MEASUREMENT REPORT message shall contain at least the best primary CPICH on the used frequency.
2. To confirm that the UE sends MEASUREMENT REPORT message when event 2D is configured and estimated quality of the currently used frequency is below the value of the IE "Threshold used frequency". This MEASUREMENT REPORT message shall contain at least the best primary CPICH on the used frequency.

### 8.4.1.26.4 Method of test

#### Initial Condition

System Simulator: 1 cells—The initial configurations of the cell in the SS shall follow the values indicated in the column marked "T0" in table 8.4.1.26-1. The table is found in "Test Procedure" clause.

UE: CS-DCCH\_DCH\_Initial (State 6-1) or PS-DCCH\_DCH\_Initial (State 6-3) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

#### Test Procedure

Table 8.4.1.26-1 illustrates the downlink power to be applied for the cell at various time instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1" is to be applied subsequently. The exact instant on which these values shall be applied is described in the text in this clause.

**Table 8.4.1.26-1**

| Parameter              | Unit | Cell 1 |     |
|------------------------|------|--------|-----|
|                        |      | T0     | T1  |
| UTRA RF Channel Number |      | Ch. 1  |     |
| CPICH $E_c$            | dBm  | -60    | -72 |

The UE is initially in CELL\_DCH state of cell 1. SS performs PHYSICAL CHANNEL RECONFIGURATION procedure to activate compressed mode. SS commands the UE to perform Inter-frequency measurements and report event 2D and/or event 2F by sending MEASUREMENT CONTROL message. Since quality estimate of used frequency is above threshold, the UE sends MEASUREMENT REPORT message indicating event 2F. SS then configures itself according to the values in columns "T1" shown above. Quality estimate for used frequency is now below threshold, the UE sends MEASUREMENT REPORT message to report it.

#### Expected Sequence

| Step | Direction |    | Message                                   | Comment                                                                                               |
|------|-----------|----|-------------------------------------------|-------------------------------------------------------------------------------------------------------|

| - Primary scrambling code        | Primary scrambling code of Cell 1 |

**8.4.1.26.5 Test Requirement**

1. In step 4 the UE shall send MEASUREMENT REPORT message indicating event 2F. IE 'Cell measurement event results' in this message shall contain frequency information and primary scrambling code of Cell 1.
2. In step 6 the UE shall send MEASUREMENT REPORT message indicating event 2D. IE 'Cell measurement event results' in this message shall contain frequency information and primary scrambling code of Cell 1.

**8.4.1.27 Measurement Control and Report: UE internal measurement for events 6A and 6B****8.4.1.27.1 Definition****8.4.1.27.2 Conformance requirement**

When in CELL\_DCH state, the UE shall start to use the new measurement and reporting parameters for UE internal measurement received in the MEASUREMENT CONTROL message. It shall transmit MEASUREMENT REPORT message, which include the measured quantity and event identity, when the reporting criteria is met.

**Reference**

3GPP TS 25.331, clauses 14.6.2.1 and 14.6.2.2.

**8.4.1.27.3 Test Purpose**

To confirm that the UE performs UE internal measurements and reporting for events 6A and 6B, when requested by the UTRAN to do so in the MEASUREMENT CONTROL message.

#### 8.4.1.27.4 Method of test

##### Initial Condition

System Simulator: 1 cell, cell 1.

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

##### Test Procedure

The UE is in CELL\_DCH state in cell 1, after successfully executing procedures P11 or P13 as specified in clause 7.4 of TS 34.108. Next, SS transmits MEASUREMENT CONTROL message to request the UE to perform UE internal measurements and reporting for events 6A and 6B.

SS increases the UE Tx power above the threshold set to event 6A. After 'time to trigger' UE sends MEASUREMENT REPORT, triggered by event 6A, to SS.

SS decreases the UE Tx power below the threshold set to event 6B. After 'time to trigger' UE sends MEASUREMENT REPORT, triggered by event 6B, to SS.

##### Expected Sequence

## 8.4.1.27.5 — Test Requirement

After step 3, the UE shall transmit MEASUREMENT REPORT message, containing measured results for UE transmitted power. The 'Event results' IE contains event identity 6A.

After step 5, the UE shall transmit MEASUREMENT REPORT message, containing measured results for UE transmitted power. The 'Event results' IE contains event identity 6B.

## 8.4.1.28 — Measurement Control and Report: UE internal measurement for events 6F and 6G

## 8.4.1.28.1 — Definition

## 8.4.1.28.2 — Conformance requirement

When in CELL\_DCH state, the UE shall start to use the new measurement and reporting parameters for UE internal measurement received in the MEASUREMENT CONTROL message. It shall transmit MEASUREMENT REPORT message, which include the measured quantity and event identity, when the reporting criteria is met.

## Reference

3GPP TS 25.331, clauses 14.6.2.6 and 14.6.2.7.

### 8.4.1.28.3 Test Purpose

To confirm that the UE performs UE internal measurements and reporting for events 6F and 6G, when requested by the UTRAN to do so in the MEASUREMENT CONTROL message.

### 8.4.1.28.4 Method of test

#### Initial Condition

System Simulator: 1 cell – The initial configuration of the cell 1 in the SS shall follow the values indicated in table 6.1.2 of TS 34.108.

UE: CS-DCCH+DTCH\_DCH (State 6-9) or PS-DCCH+DTCH\_DCH (State 6-10) in cell 1 as specified in clause 7.4 of TS 34.108, depending on the CN domain supported by the UE.

#### Test Procedure

Table 6.1.2 of TS 34.108 specifies the radio conditions to be applied for the cells in this test.

The UE is in CELL\_DCH state in cell 1, after successfully executing procedures P11 or P13 as specified in clause 7.4 of TS 34.108.

SS then performs an active set update procedure by sending ACTIVE SET UPDATE REQUEST message on the downlink DCCH. Cell 2 is to be added to the active set, according to the content of this downlink message. The UE shall reply with an ACTIVE SET UPDATE COMPLETE message on the uplink DCCH, and include cell 2 to the active set when the activation time specified has elapsed.

Next, SS transmits MEASUREMENT CONTROL message to request the UE to perform UE internal measurements and reporting for events 6F and 6G.

SS adjusts the Tx timing of cell 2 above the threshold set to event 6F. After 'time to trigger' UE sends MEASUREMENT REPORT, triggered by event 6F, to SS.

SS adjusts the Tx timing of cell 2 below the threshold set to event 6G. After 'time to trigger' UE sends MEASUREMENT REPORT, triggered by event 6G, to SS.

| — UE internal-measured results    |                                                                |
| — CHOICE mode                     | Check to see if set to "FDD"                                   |
| — UE Rx-Tx report entries         |                                                                |
| — Primary CPICH info              |                                                                |
| — Primary scrambling code         | Check to see if set to codes assigned for cell 1 & cell 2.     |
| — UE Rx-Tx time difference type 1 | Check to see if present and value is reasonable                |
| Measured Results on RACH          | Check to see if this IE is absent                              |
| Event results                     |                                                                |
| — CHOICE event result             | Check to see if set to "UE internal measurement event results" |
| — UE internal event identity      | Check to see if set to "6F"                                    |
| — CHOICE mode                     | Check to see if set to "FDD"                                   |
| — Primary CPICH info              |                                                                |
| — Primary scrambling code         | Check to see if set to code assigned for cell 2.               |

## MEASUREMENT REPORT (Step 8)

| Information Element             | Value/Remarks                                                  |
|---------------------------------|----------------------------------------------------------------|
| Measurement identity            | Check to see if set to 5                                       |
| Measured Results                |                                                                |
| CHOICE measurement              | Check to see if set to "UE Internal-measured results"          |
| UE internal-measured results    |                                                                |
| CHOICE mode                     | Check to see if set to "FDD"                                   |
| UE Rx-Tx report entries         |                                                                |
| Primary CPICH info              |                                                                |
| Primary scrambling code         | Check to see if set to codes assigned for cell 1 & cell 2.     |
| UE Rx-Tx time difference type 1 | Check to see if present and value is reasonable                |
| Measured Results on RACH        | Check to see if this IE is absent                              |
| Event results                   |                                                                |
| CHOICE event result             | Check to see if set to "UE internal measurement event results" |
| UE internal event identity      | Check to see if set to "6G"                                    |
| CHOICE mode                     | Check to see if set to "FDD"                                   |
| Primary CPICH info              |                                                                |
| Primary scrambling code         | Check to see if set to code assigned for cell 2.               |

## 8.4.1.28.5 Test Requirement

After step 5, the UE shall transmit MEASUREMENT REPORT message, containing measured results for UE Rx-Tx time difference. The 'Event results' IE contains event identity 6F.

After step 7, the UE shall transmit MEASUREMENT REPORT message, containing measured results for UE Rx-Tx time difference. The 'Event results' IE contains event identity 6G.

## 8.4.1.29 Measurement Control and Report: Event based Traffic Volume measurement in CELL\_FACH state.

## 8.4.1.29.1 Definition

## 8.4.1.29.2 Conformance requirement

Event based transport channel traffic volume measurement compares sum of buffer occupancies of RBs multiplexed onto a transport channel to the threshold, which UE receives from the network. When transport channel traffic volume exceeds threshold UE sends RRC: Measurement Report towards network. Message includes at least indication of measurement identity. In CELL\_FACH state UE has only RACH transport channel.

## Reference

3GPP TS 25.331, clause 14.4.

## 8.4.1.29.3 Test Purpose

To verify that in CELL\_FACH state when event 4a triggers UE sends RRC: Measurement Report with correct measurement identity and indication of UL transport channel type, radio-bearer identities and corresponding RLC buffer payloads in number of bytes.

## 8.4.1.29.4 Method of test

## Initial Condition

System Simulator: 1 cell

UE: CELL\_FACH state, state 6-11 as specified in clause 7.4 of TS 34.108.

System Information Block type 11 nor 12 does not include Traffic Volume measurement system information.

### Test Procedure

The UE is brought to the CELL\_FACH state after a successful incoming call attempt. The SS follows the procedure in TS 34.108 clause 7.1.3 (Mobile Terminated), to set up a user RAB, but with the default RAB replaced by the one described in 34.108, clause 6.10.2.4.3.2: Interactive/Background 32 kbps PS RAB + SRBs for CCCH + SRB for DCCH + SRB for BCCH for DL and 6.10.2.4.4.1: Interactive/Background 32 kbps PS RAB + SRB for CCCH + SRB for DCCH for UL. The radio bearer is placed into UE test loop mode 1 described in 34.109 clause 5.3. SS sends to UE RRC: MEASUREMENT CONTROL message, which includes traffic volume measurement control parameters eg: uplink transport channel type and reporting threshold. Transport channel traffic volume exceeds threshold and after 'time to trigger' UE sends RRC: MEASUREMENT REPORT to SS. SS does not respond and after 'pending time after trigger' UE sends again same RRC: MEASUREMENT REPORT.

### Expected Sequence

| Step | Direction |    | Message             | Comment                                                           |
|------|-----------|----|---------------------|-------------------------------------------------------------------|
|      | UE        | SS |                     |                                                                   |
| 1    |           |    |                     | The UE is brought to the CELL_FACH state in the cell 1.           |
| 2    |           | ←  | MEASUREMENT CONTROL | SS provides Traffic Volume measurement criterias to UE.           |
| 3    |           | →  | MEASUREMENT REPORT  | UE reports that Traffic Volume measurement event 4A is triggered. |
| 4    |           | →  | MEASUREMENT REPORT  | UE repeats message after 1000 ms.                                 |

| — Uplink transport channel type causing the event | Check to see if set to "RACH"                                 |
| — UL transport channel identity                   | Check to see that is not set                                  |
| — Traffic volume event identity                   | Check to see if set to "4a"                                   |

**8.4.1.29.5 — Test Requirement**

In step 3 UE sends RRC: MEASUREMENT REPORT with correct measurement identity indication. RB identity and RLC buffers payload has reasonable values.

In step 4 UE repeats message sent in step 3.

After step 3 UE is not allowed to send user data during the 'Tx interruption after trigger' timer is running.

**8.4.1.30 — Measurement Control and Report: Event based Traffic Volume measurement in CELL\_DCH state.****8.4.1.30.1 — Definition****8.4.1.30.2 — Conformance requirement**

Event based transport channel traffic volume measurement compares sum of buffer occupancies of RBs multiplexed onto a transport channel to the threshold, which UE receives from the network. When transport channel traffic volume exceeds threshold UE sends RRC: Measurement Report towards network. Message includes at least indication of measurement identity. In CELL\_DCH state each DCH may have own measurement activated with own threshold.

**Reference**

3GPP TS 25.331, clause 14.4.

**8.4.1.30.3 — Test Purpose**

To verify that in CELL\_DCH state when event 4a or 4b triggers UE sends RRC: Measurement Report with correct measurement identity and indication of uplink transport channel type and identity, radio bearer identities and corresponding RLC buffer payloads in number of bytes.

**8.4.1.30.4 — Method of test****Initial Condition**

System Simulator: 1 cell

UE: CELL\_DCH state, state 6-10 as specified in clause 7.4 of TS 34.108.

System Information Block type 11 nor 12 does not include Traffic Volume measurement system information.

## Test Procedure

The UE is brought to the CELL\_DCH state after a successful incoming call attempt. The SS follows the procedure in TS 34.108 clause 7.1.3 (Mobile Terminated), to set up a user RAB, but with the default RAB replaced by the one described in 34.108, clause 6.10.2.4.1.26: Interactive or background / UL: 64 kbps / PS RAB + UL: 3.4 DL: 3.4 kbps SRBs for DCCH. The radio bearer is placed into UE test loop mode 1 described in 34.109 clause 5.3. SS sends to UE RRC: MEASUREMENT CONTROL messages, which includes in addition to measurement identity traffic volume measurement control parameters eg. uplink transport channel type and identity and reporting threshold for both events 4a and 4b. Transport channel traffic volume exceeds threshold and after 'time to trigger' UE sends RRC: MEASUREMENT REPORT to SS. SS does not respond and after 'pending time after trigger' UE sends again same RRC: MEASUREMENT REPORT. UE's transport channel load decreases to zero, event 4b triggers and previous signaling procedure repeats.

~~UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.~~

~~System Information Block type 11 nor 12 does not include Inter-RAT measurement system information.~~

##### ~~Test Procedure~~

~~The UE is brought to the CELL\_DCH state after a successful outgoing call attempt. SS provides compressed mode pattern sequence parameters to UE by using physical channel reconfiguration procedure. Depending on UE's measurement capability uplink and/or downlink compressed mode is requested. Compressed mode method is SF/2 with 7 slot gap in single frame. Two normal frames is between gapped frames. First RRC: MEASUREMENT CONTROL message is used to provide measurement control parameters (GSM RSSI) to UE and to start compressed mode for measurement. UE replies according to request by sending RRC: MEASUREMENT REPORT messages periodically to SS. Reporting period is 1000 ms. After two RRC: MEASUREMENT REPORT messages, SS sends second RRC: MEASUREMENT CONTROL message to start GSM Initial BSIC identification measurement. UE replies similarly as in GSM RSSI measurement case.~~

## Expected Sequence

## MEASUREMENT REPORT (Step 8 and step 9)

| Information Element                    | Value/Remarks                                            |
|----------------------------------------|----------------------------------------------------------|
| Measurement identity                   | Check to see if set to 15                                |
| Measured Results                       |                                                          |
| — CHOICE measurement                   | Check to see if set to "Inter-RAT-measured results-list" |
| — Inter-RAT-measured result-list       |                                                          |
| — CHOISE system                        | GSM                                                      |
| — Measured GSM cells                   |                                                          |
| — GSM carrier RSSI                     | Check to see if present                                  |
| CHOISE BSIC                            | Verified BSIC                                            |
| — Inter-RAT cell id                    | Check that is set to "0"                                 |
| — Observed time difference to GSM cell | Check that not present                                   |
| — GSM carrier RSSI                     | Check that measurement result is reasonable              |
| CHOISE BSIC                            | Verified BSIC                                            |
| — Inter-RAT cell id                    | Check that is set to "1"                                 |
| — Observed time difference to GSM cell | Check that not present                                   |
| Measured results on RACH               | Check that not present                                   |
| Additional Measured results            | Check that not present                                   |
| Event results                          | Check that not present                                   |

## 8.4.1.31.5 — Test Requirement

In step 5 and step 6 UE reports correctly GSM RSSI values.

In step 8 and step 9 UE reports correctly BSIC values.

Reporting period is the requested one.

## 8.4.1.32 — Void

## 8.4.1.33 — Measurement Control and Report: Inter-RAT measurement, event 3a

## 8.4.1.33.1 — Definition

## 8.4.1.33.2 — Conformance requirement

- When this event is ordered by UTRAN in a MEASUREMENT CONTROL message the UE shall send a report when the estimated quality of the currently used frequency is below the value of the IE "Threshold own system" and the hysteresis and time to trigger conditions are fulfilled and the estimated quality of the other system is above the value of the IE "Threshold other system" and the hysteresis and time to trigger conditions are fulfilled.
- If the IE "DPCCH Compressed Mode Status Info" is present, [in the MEASUREMENT CONTROL message]:
  - after the time indicated by IE "TGPS reconfiguration CFN" has elapsed:
    - activate the pattern sequence stored in the variable TGPS\_IDENTITY corresponding to each IE "TGPSI" for which the "TGPS status flag" is set to "active" at the time indicated by IE "TGCFN"; and
    - begin the inter-frequency and/or inter-RAT measurements corresponding to the pattern sequence measurement purpose of each activated pattern sequence;
    - if the values of IE "TGPS reconfiguration CFN" and IE "TGCFN" are equal:
      - start the concerned pattern sequence immediately at that CFN;
    - not alter pattern sequences stored in variable TGPS\_IDENTITY, but not identified in IE "TGPSI"
- The UE shall perform GSM RSSI measurements in the gaps of compressed mode pattern sequence specified for GSM RSSI measurement purpose. The UE shall perform Initial BSIC identification in compressed mode pattern sequence specified for Initial BSIC identification measurement purpose. The UE shall be able to measure the

"Observed time difference to GSM cell" during a compressed mode pattern sequence configured for this purpose. The UE shall perform BSIC re-confirmation in compressed mode pattern sequence specified for BSIC re-confirmation measurement purpose.

4. If the IE "Inter-RAT measurement quantity" is received in a MEASUREMENT CONTROL message and CHOICE system is GSM, the UE shall:
  - if IE "BSIC verification required" is set to "required", for cells that match any of the BCCH ARFCN and BSIC combinations in the list of inter-RAT cells that the UE has received in IE "Inter-RAT cell info list", and that has a "verified" BSIC:
    - report measurement quantities according to IE "inter-RAT reporting quantity" taking into account the restrictions defined in clause 8.6.7.6;
    - trigger inter-RAT events according to IE "inter-RAT measurement reporting criteria"; and
  - perform event evaluation for event-triggered reporting after BSIC has been verified for a GSM cell
  - indicate non-verified BSIC for a GSM cell in the "Inter-RAT measured results list" IE
5. The UE shall include measured results in MEASUREMENT REPORT as specified in the IE "Inter-RAT reporting quantity".
6. If IE "Observed time difference to GSM cell" is set to "TRUE" [, the UE shall]:
  - include optional IE "Observed time difference to GSM cell" with the value set to the time difference to that GSM cell for the GSM cells that have a BSIC that is "verified", and that match any of the BCCH ARFCN and BSIC combinations in the list of inter-RAT cells that the UE has received in IE "Inter-RAT cell info list".
  - if IE "GSM Carrier RSSI" is set to "TRUE"[, the UE shall]:
    - include optional IE "GSM Carrier RSSI" with a value set to the measured RXLEV to that GSM cell in IE "Inter-RAT measured results list".
  - if the BSIC of reported GSM cell is "verified"[, the UE shall]:
    - set the CHOICE BSIC to "Verified BSIC" and IE "inter-RAT cell id" to the value that GSM cell had in the IE "Inter-RAT cell info list";
7. If the IE "Reporting Cell Status" is received, the UE shall set the IE "Measured Results" in MEASUREMENT REPORT as follows:
  - the maximum number of the IE "Cell Measured Results" to be included in the IE "Measured Results" is the number specified in "Reporting Cell Status".

## Reference

3GPP TS 25.331 clauses 8.4.1.3, 8.6.7.5, 8.6.7.6, 8.6.7.9, 14.3.1.1, 14.3.2.1, 14.3.2.2, 14.3.2.3.

### 8.4.1.33.3 ————— Test Purpose

1. To confirm that the UE starts compressed mode and inter-RAT measurements when so required by the network in a MEASUREMENT CONTROL message.
2. To confirm that the UE sends MEASUREMENT REPORT message if event 3a is configured, if the quality of the currently used UTRAN frequency is below a given threshold and the estimated quality of the other system is above a certain threshold.
3. To confirm that the hysteresis and time to trigger behaviours for event 3a are correctly implemented.
4. To confirm that the UE verifies the BSIC of the cell triggering the event if so required by UTRAN and if the proper compressed mode patterns have been configured in the UE by UTRAN.
5. To confirm that the content of the MEASUREMENT REPORT sent by the UE is according to what was required by UTRAN.

NOTE:—Test purpose 1 verifies conformance requirement 1 and 2.

NOTE:—Test purpose 2 and 3 verifies conformance requirement 1.

NOTE:—Test purpose 4 verifies conformance requirement 2, 3 and 4.

NOTE:—Test purpose 5 verifies conformance requirement 4, 5, 6 and 7.

#### 8.4.1.33.4 Method of test

##### Initial Condition

System simulator: 1 UTRAN FDD cell and 3 GSM cells. The initial configurations of the 3 cells in the SS shall follow the values indicated in the column marked T0. The table is found in "Test procedure".

UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.

##### Test procedure

**Table 8.4.1.33.4-1**

| Parameter       | Unit | Cell 1<br>(GSM) |     |     |     |     | Cell 2<br>(GSM) |     |     |     |     | Cell 3<br>(GSM) |     |     |     |     |
|-----------------|------|-----------------|-----|-----|-----|-----|-----------------|-----|-----|-----|-----|-----------------|-----|-----|-----|-----|

| CELL identity   | #    | 0               |     |     |     |     | 1               |     |     |     |     | 2               |     |     |     |     |
| BSIC            | #    | BSIC-1          |     |     |     |     | BSIC-2          |     |     |     |     | BSIC-3          |     |     |     |     |
| RF Signal Level | dBm  | -85             | -85 | -70 | -82 | -70 | -85             | -85 | -85 | -77 | -77 | -90             | -90 | -90 | -90 | -90 |

**Table 8.4.1.33.4-2**

| Parameter              | Unit | Cell 1<br>(UTRA) |     |     |     |
|------------------------|------|------------------|-----|-----|-----|
|                        |      | T0               | T1  | T2  | T3  |
| UTRA-RF Channel Number |      | Ch.1             |     |     |     |
| CPICH Ec/No            | dB   | -5               | -20 | -20 | -20 |

The two tables above illustrate the downlink power to be applied for the two cells at various instants of the test execution. Column marked "T0" denotes the initial conditions, while columns marked "T1", "T2" and "T3" indicate the values to be applied subsequently.

The UE is initially in CELL\_DCH, state 6-9 as specified in clause 7.4 of TS 34.108. UTRA cell 1 is the only cell in the active set of the UE. The SS sends a PHYSICAL CHANNEL RECONFIGURATION message to the UE to configure the compressed mode pattern sequence parameters to the UE. Three compressed mode patterns are configured, according to the message specified below. When the PHYSICAL CHANNEL RECONFIGURATION COMPLETE is received from the UE, the SS sends a MEASUREMENT CONTROL message to the UE, to set up inter-RAT measurements. Event 3a is set up in this message, and compressed mode is activated.

At instant T1, the CPICH Ec/No drops as described in table 8.4.1.33.4-2.

At instant T2, the RF signal for GSM cell 1 increases, and crosses the threshold for the other system defined for event 3a.

After reception of the MEASUREMENT REPORT message, at instant T3, the RF signal strength for GSM cell 2 increases above the threshold for the other system for event 3a. During that time, the RF signal strength for GSM cell 1 has dropped above the threshold for the other system for event 3a, but remains above threshold-hysteresis for event 3a.

At instant T4, the RF signal strength for GSM cell 1 increases above the threshold for the other system for event 3a+hysteresis.

#### Expected Sequence

| Step | Direction |    | Message                                   | Comment                                                                                                                   |
|------|-----------|----|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                           |                                                                                                                           |
| 1    |           |    |                                           | The UE is brought to the CELL_DCH state in the cell 1.                                                                    |
| 2    |           | ←  | PHYSICAL CHANNEL RECONFIGURATION          | Compressed mode pattern sequence parameters are loaded to UE.                                                             |
| 3    |           | →  | PHYSICAL CHANNEL RECONFIGURATION COMPLETE |                                                                                                                           |
| 4    |           | ←  | MEASUREMENT CONTROL                       | SS configures event 3a in the UE. Compressed mode is started.                                                             |
| 5    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T1" in tables 8.4.1.33.4-1 and 8.4.1.33.4-2. |
| 6    |           |    |                                           | SS waits for approximately 10 seconds and verifies that no MEASUREMENT REPORT messages are detected on uplink DCCH.       |
| 7    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T2" in tables 8.4.1.33.4-1 and 8.4.1.33.4-2. |
| 8    |           | →  | MEASUREMENT REPORT                        | After about 640 ms, the UE sends a MEASUREMENT REPORT to SS triggered by event 3a.                                        |
| 9    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T3" in tables 8.4.1.33.4-1 and 8.4.1.33.4-2. |
| 10   |           |    |                                           | SS waits for approximately 10 seconds and verifies that no MEASUREMENT REPORT messages are detected on uplink DCCH.       |
| 11   |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T4" in tables 8.4.1.33.4-1 and 8.4.1.33.4-2. |
| 12   |           |    |                                           | SS waits for approximately 10 seconds and verifies that no MEASUREMENT REPORT messages are detected on uplink DCCH.       |

## Specific Message Content

## PHYSICAL CHANNEL RECONFIGURATION (Step 2)

| -Measured GSM cells                   | Check that measurement results for two GSM cells are included                                                                                                          |
| -GSM carrier RSSI                     | Check that measurement result is reasonable                                                                                                                            |
| CHOICE BSIC                           | Check it is set to verified BSIC                                                                                                                                       |
| -inter-RAT cell id                    | Check that it is set to either 0 or 1.                                                                                                                                 |
| -Observed time difference to GSM cell | Check that the IE is present and that the reported value is reasonable                                                                                                 |
| -GSM carrier RSSI                     | Check that measurement result is reasonable                                                                                                                            |
| CHOICE BSIC                           | Verified BSIC                                                                                                                                                          |
| -inter-RAT cell id                    | Check that is set to 1 or 0 depending on the value of the previous inter-RAT cell id. (The value here shall be the one not chosen for the previous inter-RAT cell id). |
| -Observed time difference to GSM cell | Check that the IE is present and that the reported value is reasonable                                                                                                 |
| Measured results on RACH              | Check that not present                                                                                                                                                 |
| Additional Measured results           | Check that not present                                                                                                                                                 |
| Event results                         | Check that the IE is included                                                                                                                                          |
| -CHOICE event result                  | Check that this is set to inter-RAT measurement event results                                                                                                          |
| -Inter-RAT event identity             | Check that this is set to 3a                                                                                                                                           |
| -Cells to report (1 to <maxCellMeas>) | Check that <maxCellMeas> is set to 1                                                                                                                                   |
| -CHOICE BSIC                          | Check that this is set to verified BSIC                                                                                                                                |
| -Inter-RAT cell id                    | Check that this is set to 0.                                                                                                                                           |

## 8.4.1.33.5 — Test requirement

The UE shall not send any measurement report between instants T1 and T2.

Event 3a shall be triggered in the UE (i.e. the transmission of the MEASUREMENT REPORT) about 0.64 s after instant T2.

Between instants T2 and T3, no MEASUREMENT REPORT message shall be received from the UE (since the hysteresis condition for triggering event 3a is not fulfilled).

No MEASUREMENT REPORT message shall be received from the UE after instant T4 (since the signal strength for cell 1 has not dropped under Threshold for event 3a hysteresis).

## 8.4.1.34 — Measurement Control and Report: Inter-RAT measurement, event 3b

## 8.4.1.34.1 — Definition

## 8.4.1.34.2 — Conformance requirement

1. When this event is ordered by UTRAN in a measurement control message the UE shall send a report when the estimated quality of the other system is below the value of the IE "Threshold other system" and the hysteresis and time to trigger conditions are fulfilled. The corresponding report contains information specific for the other system.

2. If the IE "Inter-RAT cell info list" is received in a MEASUREMENT CONTROL message, the UE shall update the variable CELL\_INFO\_LIST accordingly and in the following order. The UE shall:

- if the IE "Removed Inter-RAT cells" is received, at the position indicated by the IE "Inter-RAT cell id":
  - clear the cell information stored in the variable CELL\_INFO\_LIST; and
  - mark the position "vacant";
- if the IE "New Inter-RAT cells" is received, for each cell, and in the same order as the cells appear in the IE:
  - update the variable CELL\_INFO\_LIST as follows:
    - if the IE "Inter-RAT cell id" is received:
      - store received cell information at this position in the Inter-RAT cell info list in the variable CELL\_INFO\_LIST, possibly overwriting any existing information in this position; and
      - mark the position "occupied";
    - if the IE "Inter-RAT cell id" is not received:
      - store the received cell information at the first vacant position in ascending order in the Inter-RAT cell info list in the variable CELL\_INFO\_LIST; and
  - mark the position as "occupied";

## Reference

3GPP TS 25.331 clause 8.6.7.3, 14.3.1.2

### 8.4.1.34.3 Test Purpose

- 1—To confirm that the UE sends MEASUREMENT REPORT message if event 3b is configured, if the estimated quality of the other system is below a given threshold.
- 2—To confirm that the hysteresis and time to trigger behaviours for event 3b are correctly implemented. To confirm that the UE updates the list of inter-RAT cells it stores according to what is ordered in the MEASUREMENT CONTROL messages received from UTRAN.

### 8.4.1.34.4 Method of test

#### Initial Condition

System simulator: 1 UTRAN FDD cell and 3 GSM cells. The initial configurations of the 4 cells in the SS shall follow the values indicated in the column marked T0. The table is found in "Test procedure".

UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.

#### Test procedure

**Table 8.4.1.34.4-1**

| Parameter       | Unit | Cell 1<br>(GSM) |     | Cell 2<br>(GSM) |     | Cell 3<br>(GSM) |     |
|-----------------|------|-----------------|-----|-----------------|-----|-----------------|-----|
|                 |      | T0              | T1  | T0              | T1  | T0              | T1  |
| Test Channel    | #    | GSM Ch.1        |     | GSM Ch.2        |     | GSM Ch.3        |     |
| BCCCH ARFCN     | #    | 1               |     | 7               |     | 2               |     |
| CELL identity   | #    | 0               |     | 1               |     | 2               |     |
| BSIC            | #    | BSIC 1          |     | BSIC 2          |     | BSIC 3          |     |
| RF Signal Level | dBm  | -70             | -90 | -70             | -70 | -90             | -90 |

The two tables above illustrate the downlink power to be applied for the two cells at various instants of the test execution. Column marked "T0" denotes the initial conditions, while column marked "T1" indicates the values to be applied subsequently.

The UE is initially in CELL\_DCH, state 6-9 as specified in clause 7.4 of TS 34.108. UTRA cell 1 is the only cell in the active set of the UE. The SS sends a PHYSICAL CHANNEL RECONFIGURATION message to the UE to configure the compressed mode pattern sequence parameters to the UE. Three compressed mode patterns are configured, according to the message specified below. When the PHYSICAL CHANNEL RECONFIGURATION COMPLETE is received from the UE, the SS sends a MEASUREMENT CONTROL message to the UE, to set up inter-RAT measurements. Event 3b is set up in this message, and compressed mode is activated. The monitored GSM cells at measurement establishment are GSM cells 1 and 2.

At instant T1, the RF signal strength for GSM cell 1 drops as described in table 8.4.1.34.4-1.

When the MEASUREMENT REPORT has been received by the SS, a MEASUREMENT CONTROL message is sent to the UE, to add GSM cell 3 to the monitored GSM cells.

A second MEASUREMENT REPORT triggered by event 3b shall be received shortly after by the SS.

#### Expected Sequence

| Step | Direction |    | Message                                   | Comment                                                                                                             |
|------|-----------|----|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                           |                                                                                                                     |
| 1    |           |    |                                           | The UE is brought to the CELL_DCH state in the cell 1.                                                              |
| 2    | ←         |    | PHYSICAL CHANNEL RECONFIGURATION          | Compressed mode pattern sequence parameters are loaded to UE.                                                       |
| 3    | →         |    | PHYSICAL CHANNEL RECONFIGURATION COMPLETE |                                                                                                                     |
| 4    | ←         |    | MEASUREMENT CONTROL                       | SS configures event 3b in the UE. Compressed mode is started.                                                       |
| 5    |           |    |                                           | SS waits for approximately 10 seconds and verifies that no MEASUREMENT REPORT messages are detected on uplink DCCH. |
| 6    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T1" in tables 8.4.1.34.4-1.            |
| 7    | →         |    | MEASUREMENT REPORT                        | After about 60 ms, the UE sends a MEASUREMENT REPORT to SS triggered by event 3b.                                   |
| 8    | ←         |    | MEASUREMENT CONTROL                       | SS adds GSM cell 3 to the list of the monitored GSM cells.                                                          |
| 9    | →         |    | MEASUREMENT REPORT                        | After about 60 ms, the UE sends a MEASUREMENT REPORT to SS triggered by event 3b.                                   |

| -Inter-RAT-cell-id                    | Check that this is set to 2.                                                                                         |

## 8.4.1.34.5 — Test requirement

Between instants T0 and T1, the UE shall not send any MEASUREMENT REPORT message to the SS.

Event 3b shall be triggered in the UE (i.e. the transmission of the first MEASUREMENT REPORT message shall begin) about 60 ms after instant T1.

About 60 ms after the reception by the UE of the second MEASUREMENT CONTROL message, the UE shall begin to transmit the second MEASUREMENT REPORT message (since the signal strength for GSM cell 3 is below the threshold for triggering event 3b).

## 8.4.1.35 — Measurement Control and Report: Inter-RAT measurement, event 3c

## 8.4.1.35.1 — Definition

## 8.4.1.35.2 — Conformance requirement

When this event is ordered by UTRAN in a measurement control message the UE shall send a report when the estimated quality of the other system is above the value of the IE "Threshold other system" and the hysteresis and time to trigger conditions are fulfilled. The corresponding report contains information specific for the other system. For the measurement, which triggered the MEASUREMENT REPORT message, the UE shall set the IE "measured results" to include measurements according to the IE "reporting quantity" of that measurement.

## Reference

3GPP TS 25.331 clauses 14.3.1.3, 8.4.2.2.

### 8.4.1.35.3 Test Purpose

- 1—To confirm that the UE sends MEASUREMENT REPORT message if event 3c is configured, and if the quality of the other system becomes better than the given threshold for event 3c.
- 2—To confirm that no other UE MEASUREMENT REPORT message is sent by the UE for a cell that has already triggered event 3c as long as the hysteresis condition for triggering once again event 3c has not been fulfilled.

### 8.4.1.35.4 Method of test

#### Initial Condition

System simulator: 1 UTRAN FDD cell and 2 GSM cells. The initial configurations of the 4 cells in the SS shall follow the values indicated in the column marked T0. The table is found in "Test procedure".

UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.

#### Test procedure

**Table 8.4.1.35.4-1**

| Parameter       | Unit | Cell 1 (GSM) |     |     |     | Cell 2 (GSM) |     |     |     |
|-----------------|------|--------------|-----|-----|-----|--------------|-----|-----|-----|
|                 |      | T0           | T1  | T2  | T3  | T0           | T1  | T2  | T3  |
| Test Channel    | #    | GSM-Ch.1     |     |     |     | GSM-Ch.2     |     |     |     |
| BCCH ARFCN      | #    | 1            |     |     |     | 7            |     |     |     |
| CELL identity   | #    | 0            |     |     |     | 1            |     |     |     |
| BSIC            | #    | BSIC 1       |     |     |     | BSIC 2       |     |     |     |
| RF Signal Level | dBm  | -90          | -80 | -90 | -80 | -80          | -80 | -80 | -80 |

The two tables above illustrate the downlink power to be applied for the two cells at various instants of the test execution. Column marked "T0" denotes the initial conditions, while column marked "T1", "T2" and "T3" indicate the values to be applied subsequently.

The UE is initially in CELL\_DCH, state 6-9 as specified in clause 7.4 of TS 34.108. UTRA cell 1 is the only cell in the active set of the UE. The SS sends a PHYSICAL CHANNEL RECONFIGURATION message to the UE to configure the compressed mode pattern sequence parameters to the UE. Three compressed mode patterns are configured, according to the message specified below. When the PHYSICAL CHANNEL RECONFIGURATION COMPLETE is received from the UE, the SS sends a MEASUREMENT CONTROL message to the UE, to set up inter-RAT measurements. Event 3c is set up in this message, and compressed mode is activated.

At instant T1, the RF signal strength for GSM cell 1 increases as described in table 8.4.1.35.4-1.

At instant T2, the RF signal strength for GSM cell 2 drops as described in table 8.4.1.35.4-1, and at instant T3, it increases again to its previous level.

## 8.4.1.35.4 — Test requirement

About 100 ms after instant T1, since the cell individual offset for GSM cell 1 is +10 dB, event 3c shall be triggered in the UE, i.e the UE shall begin to transmit a MEASUREMENT REPORT to the SS. Note that GSM cell 2 has not triggered event 3c even though the RF signal strength for GSM cell 2 is the same as for cell 1, because the cell individual offset for GSM cell 2 is 0 dB.

After instant T2, no MEASUREMENT REPORT shall be received from the UE, since GSM cell 1 has already triggered event 3c, and since the RF signal strength has not dropped enough for it to trigger the event once again.

## 8.4.1.36 — Measurement Control and Report: Inter-RAT measurement, event 3d

## 8.4.1.36.1 — Definition

## 8.4.1.36.2 — Conformance requirement

If any of the quality estimates for the cells in the other system becomes better than the quality estimate for the currently best cell in the other system, and event 3d has been ordered by UTRAN then this event shall trigger a report to be sent from the UE when the hysteresis and time to trigger conditions is fulfilled. The corresponding report contains (at least) information the best cell in the other system.

## Reference

3GPP TS 25.331 clause 14.3.1.4.

## 8.4.1.36.3 — Test Purpose

To confirm that the UE sends MEASUREMENT REPORT message if event 3d is configured, and if the best cell changes in the other system. To confirm that no other UE MEASUREMENT REPORT message is sent by the UE for a

cell that has already triggered event 3d as long as the hysteresis condition for triggering once again event 3d has not been fulfilled.

#### 8.4.1.36.4 Method of test

##### Initial Condition

System simulator: 1 UTRAN FDD cell and 2 GSM cells. The initial configurations of the 4 cells in the SS shall follow the values indicated in the column marked T0. The table is found in "Test procedure".

UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.

##### Test procedure

**Table 8.4.1.36.4-1**

| Parameter       | Unit | Cell 1<br>(GSM) |     | Cell 2<br>(GSM) |     |
|-----------------|------|-----------------|-----|-----------------|-----|
|                 |      | T0              | T2  | T0              | T1  |
| Test Channel    | #    | GSM Ch.1        |     | GSM Ch.2        |     |
| BCCH ARFCN      | #    | 1               |     | 7               |     |
| CELL identity   | #    | 0               |     | 1               |     |
| BSIC            | #    | BSIC 1          |     | BSIC 2          |     |
| RF Signal Level | dBm  | -70             | -90 | -90             | -70 |

The two tables above illustrate the downlink power to be applied for the two cells at various instants of the test execution. Column marked "T0" denotes the initial conditions, while column marked "T1", "T2" and "T3" indicate the values to be applied subsequently.

The UE is initially in CELL\_DCH, state 6-9 as specified in clause 7.4 of TS 34.108. UTRA cell 1 is the only cell in the active set of the UE. The SS sends a PHYSICAL CHANNEL RECONFIGURATION message to the UE to configure the compressed mode pattern sequence parameters to the UE. Three compressed mode patterns are configured, according to the message specified below. When the PHYSICAL CHANNEL RECONFIGURATION COMPLETE is received from the UE, the SS sends a MEASUREMENT CONTROL message to the UE, to set up inter-RAT measurements. Event 3d is set up in this message, and compressed mode is activated.

At instant T1, the RF signal strength for GSM cell 1 increases while the RF signal strength for GSM cell 2 decreases as described in table 8.4.1.36.4-1.

A MEASUREMENT CONTROL is then sent to the UE that releases the inter-RAT measurement, and deactivates compressed mode.

**8.4.1.35.4 Test requirement**

Shortly after the UE has received the first MEASUREMENT CONTROL message it shall transmit a MEASUREMENT REPORT to the SS.

About 200 ms after instant T1, the UE shall begin to transmit a MEASUREMENT REPORT triggered by event 3d to the SS.

After receiving the second MEASUREMENT CONTROL message, the UE shall then stop running compressed mode.

**8.4.1.37 Measurement Control and Report: UE internal measurement, event 6c****8.4.1.37.1 Definition****8.4.1.37.2 Conformance requirement**

When this event is ordered by UTRAN in a measurement control message, the UE shall send a measurement report when the UE Tx power reaches its minimum value.

**Reference**

3GPP TS 25.331 clause 14.6.2.3.

**8.4.1.37.3 Test Purpose**

To confirm that the UE sends a measurement report for event 6c when the UE Tx power reaches its minimum value when event 6c has been configured in the UE through a MEASUREMENT CONTROL message.

**8.4.1.37.4 Method of test****Initial Condition**

System simulator: 1 UTRAN FDD cell.

UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.

**Test procedure**

The UE is initially in CELL\_DCH, state 6-9 as specified in clause 7.4 of TS 34.108.

The SS sends a MEASUREMENT CONTROL message to the UE that configures event 6c.

The SS sends TPC\_cmd equal to -1 until the transmitter power of the UE reaches its minimum value.

#### Expected sequence

| Step | Direction |    | Message             | Comment                                                                                                                         |
|------|-----------|----|---------------------|---------------------------------------------------------------------------------------------------------------------------------|

| CHOICE mode                     |                                                                    |
| Primary CPICH info              | This IE should not be included                                     |

## 8.4.1.37.5 Test requirement

The UE shall then begin transmitting a MEASUREMENT REPORT message to SS triggered by event 6c when its transmit power has reached its minimum output power. The minimum transmitted power of the UE shall be less than -50dBm.

## 8.4.1.38 Measurement Control and Report: UE internal measurement, event 6d

## 8.4.1.38.1 Definition

## 8.4.1.38.2 Conformance requirement

When this event is ordered by UTRAN in a measurement control message, the UE shall send a measurement report when the UE Tx power reaches its maximum value.

## Reference

3GPP TS 25.331 clause 14.6.2.4

## 8.4.1.38.3 Test Purpose

To confirm that the UE sends a measurement report for event 6d when the UE Tx power reaches its maximum value when event 6d has been configured in the UE through a MEASUREMENT CONTROL message.

## 8.4.1.38.4 Method of test

## Initial Condition

System simulator: 1 UTRAN FDD cell.

UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.

## Test procedure

The UE is initially in CELL\_DCH, state 6-9 as specified in clause 7.4 of TS 34.108.

The SS sends TPC\_cmd equal to +1 until the transmitter power of the UE reaches its maximum value.

## Expected sequence

| Step | Direction |    | Message             | Comment                                                                                           |
|------|-----------|----|---------------------|---------------------------------------------------------------------------------------------------|
|      | UE        | SS |                     |                                                                                                   |
| 1    |           |    |                     | The UE is brought to the CELL_DCH state in the cell 1.                                            |
| 2    |           | ←  | MEASUREMENT CONTROL | SS configures event 6d in the UE.                                                                 |
| 3    |           | ←  |                     | The SS sends TPC_cmd equal to +1 until the transmitter power of the UE reaches its maximum value. |
| 4    |           | →  | MEASUREMENT REPORT  | After about 200 ms, the UE sends a MEASUREMENT REPORT to SS triggered by event 6d.                |

## MEASUREMENT CONTROL (Step 1)

| Information Element                                      | Value/Remark          |

| — Primary CPICH info              | This IE should not be included                                     |

## 8.4.1.39.5 ——— Test requirement

The UE shall then begin transmitting a MEASUREMENT REPORT message to SS triggered by event 6e when the UE RSSI reaches the UE's receiver dynamic range.

## 8.4.1.40 ——— Measurement Control and Report: Inter-RAT measurement, event 3C, in CELL\_DCH state using sparse compressed mode pattern

## 8.4.1.40.1 ——— Definition

## 8.4.1.40.2 ——— Conformance requirement

1. Upon reception of a MEASUREMENT CONTROL message the UE shall perform actions specified in 3GPP TS 25.331 clause 8.6 unless otherwise specified below.

The UE shall:

- read the IE "Measurement command";
- if the IE "measurement command" has the value "setup":

- store this measurement in the variable MEASUREMENT\_IDENTITY according to the IE "measurement identity", possibly overwriting the measurement previously stored with that identity;
  - for measurement types "inter-RAT measurement" or "inter-frequency measurement":
    - if, according to its measurement capabilities, the UE requires compressed mode to perform the measurements and a compressed mode pattern sequence with an appropriate measurement purpose is simultaneously activated by the IE "DPCH compressed mode status info"; or
    - if, according to its measurement capabilities, the UE does not require compressed mode to perform the measurements:
    - begin measurements according to the stored control information for this measurement identity;
2. Event 3c: The estimated quality of other system is above a certain threshold. When this event is ordered by UTRAN in a measurement control message the UE shall send a report when the estimated quality of the other system is above the value of the IE "Threshold other system" and the hysteresis and time to trigger conditions are fulfilled. The corresponding report contains information specific for the other system.

## Reference

3GPP TS 25.331 clause 8.4.1.3, 14.3.1.3.

### 8.4.1.40.3 Test Purpose

1. To verify that the UE performs Inter-RAT measurement using a sparse compressed mode pattern as specified in the MEASUREMENT CONTROL message.
2. To verify that the UE send MEASUREMENT REPORT message when event 3C is triggered, and if the quality of the other system becomes better than the given threshold for event 3c.
3. To confirm that no other UE MEASUREMENT REPORT message is sent by the UE for a cell that has already triggered event 3c as long as the hysteresis condition for triggering once again event 3c has not been fulfilled.

### 8.4.1.40.4 Method of test

**Table 8.4.1.40.4.1 Sparse compressed mode pattern for Inter.RAT measurement**

NOTE 1: TGCFN can be found in the MEASUREMENT CONTROL message.

## Initial Condition

System simulator: 1 UTRAN FDD cell and 2 GSM cells. The initial configurations of the 2 cells in the SS shall follow the values indicated in the column marked T0. The table is found in "Test procedure".

UE: CELL\_DCH state, state 6-9 as specified in clause 7.4 of TS 34.108.

## Test procedure

Table 8.4.1.40.4.2 Inter-RAT cell specific data

| Parameter       | Unit | Cell 1<br>(GSM) |     |     |     | Cell 2<br>(GSM) |     |     |     |
|-----------------|------|-----------------|-----|-----|-----|-----------------|-----|-----|-----|
|                 |      | T0              | T1  | T2  | T3  | T0              | T1  | T2  | T3  |
| Test Channel    | #    | GSM Ch.1        |     |     |     | GSM Ch.2        |     |     |     |
| BCCH ARFCN      | #    | 1               |     |     |     | 3               |     |     |     |
| CELL identity   | #    | 0               |     |     |     | 1               |     |     |     |
| BSIC            | #    | BSIC 1          |     |     |     | BSIC 2          |     |     |     |
| RF Signal Level | dBm  | -90             | -80 | -90 | -80 | -80             | -80 | -80 | -80 |

GSM cell 3 to 12 as indicated in the a MEASUREMENT CONTROL message shall not be active in the test, i.e. no BCCH carrier shall be transmitted for GSM cell 3 to 12 in this test.

The table above illustrate the downlink power to be applied for the two cells at various instants of the test execution. Column marked "T0" denotes the initial conditions, while column marked "T1", "T2" and "T3" indicate the values to be applied subsequently.

The UE is initially in CELL\_DCH, state 6-9 as specified in clause 7.4 of TS 34.108. UTRA cell 1 is the only cell in the active set of the UE. The SS sends a PHYSICAL CHANNEL RECONFIGURATION message to the UE to configure the compressed mode pattern sequence parameters to the UE. Three compressed mode patterns are configured, according to the message specified below. When the PHYSICAL CHANNEL RECONFIGURATION COMPLETE is received from the UE, the SS sends a MEASUREMENT CONTROL message to the UE, to set up inter-RAT measurements on 12 GSM cells. Event 3c is set up in this message, and compressed mode is activated.

At instant T1, the RF signal strength for GSM cell 1 increases as described in table 8.4.1.40.4.2, since the cell individual offset for GSM cell 1 is 10 dB, event 3c shall be triggered in the UE. A MEASUREMENT REPORT shall be sent to the SS. Note that GSM cell 2 has not triggered event 3c even though the RF signal strength for GSM cell 2 is the same as for cell 1, because the cell individual offset for GSM cell 2 is 0 dB.

At instant T2, the RF signal strength for GSM cell 1 drops as described in table 8.4.1.40.4.2, and at instant T3, it increases again to its previous level. No MEASUREMENT REPORT shall be received from the UE, since GSM cell 1 has already triggered event 3c, and since the RF signal strength has not dropped enough for it to trigger the event once again.

## Expected Sequence

| Step | Direction |    | Message                                   | Comment                                                                                                             |
|------|-----------|----|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|      | UE        | SS |                                           |                                                                                                                     |
| 1    |           |    |                                           | The UE is brought to the CELL_DCH state in the cell 1.                                                              |
| 2    |           | ←  | PHYSICAL CHANNEL RECONFIGURATION          | Compressed mode pattern sequence parameters are loaded to UE.                                                       |
| 3    |           | →  | PHYSICAL CHANNEL RECONFIGURATION COMPLETE |                                                                                                                     |
| 4    |           | ←  | MEASUREMENT CONTROL                       | SS configures event 3c in the UE. Compressed mode is started.                                                       |
| 5    |           |    |                                           | SS waits for approximately 10 seconds and verifies that no MEASUREMENT REPORT messages are detected on uplink DCCH. |
| 6    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T1" in table 8.4.1.40.4.2.             |
| 7    |           | →  | MEASUREMENT REPORT                        | After about 2 s, the UE sends a MEASUREMENT REPORT to SS triggered by event 3c.                                     |
| 8    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T2" in table 8.4.1.40.4.2.             |
| 9    |           |    |                                           | SS re-adjusts the downlink transmission power settings according to columns "T3" in table 8.4.1.40.4.2.             |
| 10   |           |    |                                           | SS waits for approximately 10 seconds and verifies that no MEASUREMENT REPORT messages are detected on uplink DCCH. |

## 8.4.1.40.5 ——— Test Requirement

About 2 s after instant T1, since the cell individual offset for GSM cell 1 is +10 dB, event 3c shall be triggered in the UE, i.e the UE shall begin to transmit a MEASUREMENT REPORT to the SS. Note that GSM cell 2 has not triggered event 3c even though the RF signal strength for GSM cell 2 is the same as for cell 1, because the cell individual offset for GSM cell 2 is 0 dB.

After instant T2, no MEASUREMENT REPORT shall be received from the UE, since GSM cell 1 has already triggered event 3c, and since the RF signal strength has not dropped enough for it to trigger the event once again.

## ~~9 Elementary procedures of mobility management~~

~~The tests are based on TS 24.008.~~

~~In this clause, when the expected sequence require that "a mobile-originated CM connection is attempted", it shall be for a service other than emergency call.~~

~~In this clause, a initial CM message is either a SETUP message, a REGISTER message or a CP-DATA message (in that case the acknowledged mode of operation on SAPI 3 will have be established and this message will be sent on SAPI 3).~~

### ~~9.1 TMSI reallocation~~

~~The intention of the TMSI Reallocation procedure is to assign a new temporary identity for the UE. If the message is not understood by the UE, the network could not establish a link to the UE. As this is a common MM procedure, it can be initiated at any time.~~

#### ~~9.1.1 Definition~~

#### ~~9.1.2 Conformance requirement~~

- ~~1) A UE shall acknowledge a new TMSI when explicitly allocated during a location updating procedure or an incoming call.~~
- ~~2) The TMSI shall be updated on the USIM when the UE is correctly deactivated in accordance with the manufacturer's instructions.~~
- ~~3) A UE shall answer paging with this TMSI and includes it in the PAGING RESPONSE message.~~

#### ~~Reference(s)~~

~~TS 24.008 clause 4.3.1.~~

#### ~~9.1.3 Test purpose~~

~~To verify that the UE is able to receive and acknowledge a new TMSI by means of an explicit TMSI reallocation procedure.~~

~~To verify that the UE has stored the TMSI in a non-volatile memory.~~

~~The implicit reallocation procedure is tested in clause 9.4.1.~~

#### ~~9.1.4 Method of test~~

##### ~~Initial conditions~~

- ~~— System Simulator:~~
  - ~~— two cells A and B, belonging to different location areas a and b, default parameters.~~
- ~~— User Equipment:~~
  - ~~— the UE has valid TMSI (= TMSI1), CKSN, CK, IK. It is "idle updated" on cell B.~~

##### ~~Related ICS/IXIT statement(s)~~

~~Switch-off button Yes/No.~~

~~Way to bring the UE into service.~~

### Test Procedure

The UE is paged in cell B and the security mode is established. An explicit TMSI reallocation procedure is performed. The RRC CONNECTION is released. The UE is switched off and then its power supply is interrupted for 10 s. The power supply is resumed and then the UE is switched on and allowed sufficient time to guarantee that the UE is in service (listening to its paging subchannel). The system simulator then checks, by paging, whether the UE has stored the received TMSI.

The UE is made to select cell A. A normal location updating procedure is performed in cell A. An explicit TMSI reallocation procedure is performed and then the location updating procedure is accepted by the SS. The system simulator checks, by paging, whether the UE has stored the allocated TMSI.

### Specific message contents

None.

#### 9.1.5 Test requirement

At step 5 the UE shall receive and acknowledge a new TMSI (TMSI2) and has stored that in the USIM, and the UE is switched off and on after step 9 and 10.

At step 13 the UE shall transmit a new TMSI2 and includes it in the PAGING RESPONSE message.

At step 27 the UE shall answer paging with this TMSI1 and includes it in the PAGING RESPONSE message.

## 9.2 Authentication

The purpose of this procedure is to verify the user identity. A correct response is essential to guarantee the establishment of the connection. If not, the connection will drop.

The SS shall be able to handle vectors of AUTN, RAND, CK, IK, AUTS and XRES in a similar way as the MSC/BSS entities. The SS and test USIM shall incorporate a test algorithm for generating RES and CK, IK from RAND, AUTN and IK which operates as described in TS 34.108 clause 8.1.2.

### 9.2.1 Authentication accepted

#### 9.2.1.1 Definition

#### 9.2.1.2 Conformance requirement

- 1) A UE shall correctly respond to an AUTHENTICATION REQUEST message by sending an AUTHENTICATION RESPONSE message with the RES information field set to the same value as the one produced by the authentication algorithm in the network.
- 2) A UE shall indicate in a PAGING RESPONSE message the ciphering key sequence number which was allocated to it through the authentication procedure.

#### Reference(s)

TS 24.008 clauses 4.3.2.2 and 4.3.2.4.

#### 9.2.1.3 Test purpose

- 1) To check that a UE correctly responds to an AUTHENTICATION REQUEST message by sending an AUTHENTICATION RESPONSE message with the RES information field set to the same value as the one produced by the authentication algorithm in the network.
- 2) To check that a UE indicates in a PAGING RESPONSE message the ciphering key sequence number which was allocated to it through the authentication procedure.

#### 9.2.1.4 Method of test

##### Initial conditions

- System Simulator:
- 1 cell, default parameters.
- User Equipment:
- the UE has valid TMSI, CKSN (CKSN1), CK, IK. It is "idle updated" on the cell.

##### Related ICS/IXIT statement(s)

None.

##### Test Procedure

The UE is paged. After the UE has sent a PAGING RESPONSE message to the SS, the SS initiates an authentication procedure and checks the value RES sent by the UE in the AUTHENTICATION RESPONSE message. The RRC CONNECTION is released. The UE is paged and the SS checks the value of the ciphering key sequence number sent by the UE in the PAGING RESPONSE message.

##### Specific message contents

None.

#### 9.2.1.5 Test requirement

- 1) At step 4 the UE shall send an AUTHENTICATION RESPONSE message with the RES information field set to the same value as the XRES calculated by the SS.
- 2) At step 8 the UE shall indicate in a PAGING RESPONSE message the ciphering key sequence number which was allocated to it through the authentication procedure.

## ~~9.2.2 Authentication rejected by the network~~

### ~~9.2.2.1 Definition~~

### ~~9.2.2.2 Conformance requirement~~

- ~~1) After reception of an AUTHENTICATION REJECT message the UE shall:
  - ~~1.1 not perform normal location updating;~~
  - ~~1.2 not perform periodic location updating;~~
  - ~~1.3 not respond to paging with TMSI;~~
  - ~~1.4 reject any request from CM entity for MM connection except for emergency call;~~
  - ~~1.5 not perform IMSI detach if deactivated.~~~~
- ~~2) After reception of an AUTHENTICATION REJECT message the UE, if it supports speech, shall accept a request for an emergency call by sending a RRC CONNECTION REQUEST message with the establishment cause set to "emergency call" and include an IMEI as mobile identity in the CM SERVICE REQUEST message.~~
- ~~3) After reception of an AUTHENTICATION REJECT message the UE shall delete the stored LAI, CKSN and TMSI.~~

### Reference(s)

TS 24.008 clause 4.3.2.5.

### ~~9.2.2.3 Test purpose~~

- ~~1) To check that ,after reception of an AUTHENTICATION REJECT message, the UE:
  - ~~1.1 does not perform normal location updating;~~
  - ~~1.2 does not perform periodic location updating;~~
  - ~~1.3 does not respond to paging with TMSI;~~
  - ~~1.4 rejects any request from CM entity for MM connection except for emergency call;~~
  - ~~1.5 does not perform IMSI detach if deactivated.~~~~
- ~~2) To check that, after reception of an AUTHENTICATION REJECT message the UE, if it supports speech, accepts a request for an emergency call by sending a RRC CONNECTION REQUEST message with the establishment cause set to "emergency call" and includes an IMEI as mobile identity in the CM SERVICE REQUEST message.~~
- ~~3) To check that, after reception of an AUTHENTICATION REJECT message and after having been deactivated and reactivated, the UE performs location updating using its IMEI as mobile identity and indicates deleted LAI and CKSN.~~

### ~~9.2.2.4 Method of test~~

### Initial conditions

- ~~— System Simulator:~~
  - ~~— two cells: A and B, belonging to different location areas a and b;~~
  - ~~— IMSI attach/detach is allowed in both cells;~~
  - ~~— the T3212 time-out value is 1/10 hour in both cells.~~

—User Equipment:

—the UE has valid TMSI, CKSN (CKSN2), CK and IK. It is "idle updated" on cell B.

#### Related ICS/IXIT statement(s)

USIM removal possible while UE is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

#### Test procedure

The SS rejects an authentication. The RRC CONNECTION is released. The SS checks that the UE has entered the state MM IDLE substate NO IMSI, i.e. does not perform normal location updating, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if USIM detachment is performed, switch off is performed, or the power is removed, depending on the UE (see ICS/IXIT).

### Specific message contents

None.

#### 9.2.2.5 Test requirement

1)-

1.1 At step 24 the UE shall not send any RRC CONNECTION REQUEST on cell A or on cell B.

1.2 At step 25 the UE shall not send any RRC CONNECTION REQUEST on cell A or on cell B.

1.3 At step 9 the UE shall not respond to paging.

1.4 At step 12 the UE shall not send any RRC CONNECTION REQUEST on cell A or on cell B.

1.5 At step 28 the UE shall not send any RRC CONNECTION REQUEST on cell A or on cell B.

2)- At step 14 the UE shall send a RRC CONNECTION REQUEST message with the establishment cause set to "emergency call"; and at step 17 the UE shall send a CM SERVICE REQUEST message with the "CM service type" set to "Emergency call establishment".

3)- At step 33 the UE shall perform location updating using its IMSI as mobile identity and indicates deleted LAI and CKSN.

### 9.2.3 Authentication rejected by the UE (MAC code failure)

#### 9.2.3.1 Definition

Following a UMTS authentication challenge, the UE may reject the core network, on the grounds of an incorrect AUTN parameter (see TS 33.102).

If the UE considers the MAC code (supplied by the core network in the AUTN parameter) to be invalid, it shall send an AUTHENTICATION FAILURE message to the network, with the reject cause 'MAC failure'.

#### 9.2.3.2 Conformance requirement

1)- A UE shall correctly respond to an AUTHENTICATION REQUEST message by sending an AUTHENTICATION FAILURE message with the reject cause 'MAC failure'. A UE shall correctly respond to an AUTHENTICATION REQUEST message with correct AUTN parameter by sending AUTHENTICATION RESPONSE message after identification procedure.

2)- Upon reception of an IDENTITY REQUEST message, the UE shall identify itself by sending an IDENTITY RESPONSE message including the IMSI to the network.

- 3) Upon receiving the second AUTHENTICATION REQUEST message from the network, the UE shall stop the timer T3214, if running, and then process the challenge information as normal. Upon successfully validating the network (an AUTHENTICATION REQUEST that contains a valid MAC is received), the UE shall send the AUTHENTICATION RESPONSE message to the network and shall start any retransmission timers (e.g. T3210, T3220 or T3230), if they were running and stopped when the UE received the first AUTHENTICATION REQUEST message containing an invalid MAC.

#### Reference(s)

TS 24.008 clauses 4.3.2.5.1 and 4.3.2.6 (c)

#### 9.2.3.3 ————— Test purpose

- 1) To check that a UE shall correctly respond to an AUTHENTICATION REQUEST message by sending an AUTHENTICATION FAILURE message with the reject cause 'MAC failure'. A UE shall correctly respond to an AUTHENTICATION REQUEST message with correct AUTN parameter by sending AUTHENTICATION RESPONSE message after identification procedure.
- 2) To verify that upon reception of an IDENTIFY REQUEST message the UE identifies itself by sending an IDENTIFY RESPONSE message including the IMSI to the network.
- 3) To verify that upon receiving the second AUTHENTICATION REQUEST message from the network, the UE shall stop the timer T3214, if running, and then process the challenge information as normal. To verify that upon successfully validating the network (an AUTHENTICATION REQUEST that contains a valid MAC is received), the UE sends the AUTHENTICATION RESPONSE message to the network.

#### 9.2.3.4 ————— Method of test

##### Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE has valid TMSI, CKSN (CKSN1), CK, IK. It is "idle updated" on the cell.

##### Related ICS/IXIT statement(s)

None.

##### Test procedure

The UE rejects an authentication. The AUTHENTICATION FAILURE is sent by UE. Upon receipt of the AUTHENTICATION FAILURE message. The SS initiates identification procedure. The UE responded to the SS by sending IDENTIFY RESPONSE message. The SS sends AUTHENTICATION REQUEST message with correct AUTN parameter.

## Specific message contents

None.

## 9.2.3.5 ————— Test requirement

- 1) At step 4 the UE shall send AUTHENTICATION-FAILURE message with reject cause set to "MAC failure".
- 2) At step 6 the UE shall send an IDENTITY-RESPONSE message including the IMSI.
- 3) At step 8 the UE shall send an AUTHENTICATION-RESPONSE message.

## 9.2.4 — Authentication rejected by the UE (SQN failure)

## 9.2.4.1 ————— Definition

Following a UMTS authentication challenge, the UE may reject the core network, on the grounds of an incorrect AUTN parameter (see TS 33.102).

If the UE considers the SQN (supplied by the core network in the AUTN parameter) to be out of range, it shall send an AUTHENTICATION-FAILURE message to the network, with the reject cause 'Synch failure' and a re-synchronisation token AUTS provided by the USIM (see TS 33.102).

## 9.2.4.2 ————— Conformance requirement

- 1) A UE shall correctly respond to an AUTHENTICATION-REQUEST message by sending an AUTHENTICATION-FAILURE message with the reject cause 'Synch failure' and parameter (AUTS) provided by the USIM (see TS 33.102).
- 2) Upon successfully validating the network (a second AUTHENTICATION-REQUEST is received which contains a valid SQN) while T3216 is running, the UE shall send the AUTHENTICATION-RESPONSE message to the network and shall start any retransmission timers (e.g. T3210, T3220 or T3230), if they were running and stopped when the UE received the first AUTHENTICATION-REQUEST message containing an invalid SQN.

## Reference(s)

TS 24.008 clause 4.3.2.5.1, 4.3.2.6 (d)

## 9.2.4.3 ————— Test purpose

- 1) To check that a UE shall correctly respond to an AUTHENTICATION-REQUEST message by sending an AUTHENTICATION-FAILURE message with the reject cause 'Synch failure' and parameter (AUTS) provided by the USIM (see TS 33.102).

- 2) To check that upon successfully validating the network (a second AUTHENTICATION REQUEST is received which contains a valid SQN) while T3216 is running, the UE shall send the AUTHENTICATION RESPONSE message to the network.

#### 9.2.4.4 Method of test

##### Initial conditions

- System Simulator:
  - 1 cell, default parameters.
- User Equipment:
  - the UE has valid TMSI, CKSN (CKSN1), CK, IK. It is "idle updated" on the cell.

##### Related ICS/IXIT statement(s)

None.

##### Test procedure

The SS sends an AUTHENTICATION REQUEST having an invalid SQN code (i.e. uses the predefined  $AMF_{RESYNCH}$  value to trigger the SQN re-synchronisation procedure, see TS 34.108 clause 8.1.2.2) to the UE. The SS verifies that the UE rejects the authentication.

The SS sends a second AUTHENTICATION REQUEST with a valid SQN code (i.e. uses an AMF value different from  $AMF_{RESYNCH}$  value, see TS 34.108 clause 8.1.2.2). The SS checks that the UE accepts the authentication request.

| 7    | ←         |    | RRC CONNECTION RELEASE                                       |                                                                                                                                                                |
| 8    | →         |    | RRC CONNECTION RELEASE COMPLETE                              |                                                                                                                                                                |

##### Specific message contents

None.

#### 9.2.4.5 Test requirement

- 1) At step 4 the UE shall reject an authentication and the AUTHENTICATION FAILURE is sent to SS with reject cause "Synch failure".
- 2) At step 6 the UE shall send an AUTHENTICATION RESPONSE message with the RES information field set to the same value as the XRES calculated by SS.

## 9.3 Identification

The purpose of this procedure is to check that the UE gives its identity as requested by the network. If this procedure does not work, it will not be possible for the network to rely on the identity claimed by the UE.

### 9.3.1 General Identification

#### 9.3.1.1 Definition

#### 9.3.1.2 Conformance requirement

- 1) When requested by the network the UE shall send its IMSI.
- 2) When requested by the network the UE shall send the TMSI which it was previously allocated.
- 3) When requested by the network the UE shall send its IMEI as stored in the UE.
- 4) When requested by the network the UE shall send its IMEISV as stored in the UE.

#### Reference(s)

TS 24.008 clause 4.3.3.

#### 9.3.1.3 Test purpose

- 1) To verify that the UE sends identity information as requested by the system in the following cases: IMSI and TMSI are requested in non-security mode, IMEI is requested in security mode.
- 2) To verify that the UE sends its IMEI, when requested to do so, in non-security mode.
- 3) To verify that the UE sends its IMEISV, when requested to do so, in non-security mode.

#### 9.3.1.4 Method of test

##### 9.3.1.4.1 Identification / test 1

#### Initial conditions

- System Simulator:
  - 1 cell, default values.
- User Equipment:
  - the UE has a valid TMSI. It is "idle-updated" on the cell.

#### Related ICS/IXIT statement(s)

IMEI of the UE.

#### Test Procedure

The SS requests identity information from the UE:

- IMSI in non-security mode;
- allocated TMSI in non-security mode;
- IMEI in security mode.

## Specific message contents

None.

## 9.3.1.5 Test requirement

- 1) At step 4 in test 1 and test 2 the UE shall send its IMSI.
- 2) At step 6 in test 1 the UE shall send the TMSI which it was previously allocated.
- 3) At step 10 in test 1 the UE shall send its IMEI as stored in the UE.
- 4) At step 6 in test 2 the UE shall send its IMEISV as stored in the UE.

## 9.3.2 Handling of IMSI shorter than the maximum length

## 9.3.2.1 Definition

## 9.3.2.2 Conformance requirement

The UE shall be capable of handling an IMSI that is not of the maximum length.

## Reference(s)

TS 24.008 clause 10.5.1.4.

## 9.3.2.3 Test purpose

To check that the UE behaves correctly when activated with an IMSI of length less than the maximum length.

In this condition, the UE shall:

- perform location updating;
- answer to paging with IMSI;
- give the correct IMSI when asked by an IDENTITY REQUEST;
- attempt CM connection establishment when requested to;
- attempt call re-establishment when needed;
- attempt IMSI detach when needed;
- erase its TMSI when the IMSI is sent by the network in a LOCATION UPDATING ACCEPT or a TMSI REALLOCATION COMMAND message.

### 9.3.2.4 ~~Method of test~~

#### ~~Initial conditions~~

- ~~— System Simulator:~~
  - ~~— 1 cell, default values;~~
  - ~~— IMSI attach/detach bit set to "1".~~
- ~~— User Equipment:~~
  - ~~— the UE has no valid TMSI;~~
  - ~~— it is "idle-updated";~~
  - ~~— the IMSI has the value 001011234.~~

#### ~~Related ICS/IXIT statement(s)~~

~~On/Off switch – Yes/No.~~

#### ~~Foreseen final state of UE~~

~~The UE has no valid TMSI. It is in "idle-updated".~~

#### ~~Test Procedure~~

~~The UE is paged with its IMSI. The UE shall answer to paging and include the correct IMSI in the PAGING RESPONSE message. During call establishment, the SS asks for the IMSI of the UE. The UE shall answer by an IDENTITY RESPONSE message including the correct IMSI. During the active phase of the call, the SS modifies the scrambling code of DL DPCH. The UE performs call re-establishment. The UE shall include the correct IMSI in the CM-RE-ESTABLISHMENT message, a TMSI REALLOCATION COMMAND including a TMSI is sent to the UE. The UE acknowledges this message. The call is release.~~

~~The UE is paged with its TMSI. The UE shall answer to paging and includes its TMSI in the PAGING RESPONSE message. During call establishment, the SS sends a TMSI REALLOCATION COMMAND including the IMSI to the UE. The UE shall acknowledge this message. The UE shall erase its TMSI. The call is released.~~

~~The UE is switched off or has its power source removed. The UE performs IMSI detach. The UE shall include the correct IMSI in the IMSI DETACH INDICATION message.~~

~~The UE is switched on or powered on. The UE performs IMSI attach. The UE shall include the correct IMSI in the LOCATION UPDATING REQUEST message. A TMSI is allocated to the UE.~~

~~The LAC of the cell is changed. The UE performs location updating. The SS includes the IMSI in the LOCATION UPDATING ACCEPT message.~~

~~A mobile-originated CM connection is attempted. The UE shall include the correct IMSI in the CM SERVICE REQUEST message.~~

### Specific message contents

None.

#### 9.3.2.5 Test requirement

At step 34 the UE shall perform location updating.

At step 2 the UE shall answer to paging with IMSI.

At step 4 the UE shall answer the correct IMSI to the SS by an IDENTITY RESPONSE message.

At step 51 the UE shall attempt CM connection establishment and include the correct IMSI in the CM SERVICE REQUEST message.

At step 10 the UE shall perform call re-establishment with the correct IMSI in the CM RE-ESTABLISHMENT message.

At step 19 the IMSI is sent by the network in a TMSI REALLOCATION COMMAND message, at step 27 the UE shall attempt IMSI detach.

At step 44 the IMSI is sent by the network in a LOCATION-UPDATING-ACCEPT message, at step 51 the UE shall attempt IMSI detach.

## 9.4 Location updating

This procedure is used to register the UE in the network. If it is not performed correctly, no call can be established.

## ~~9.4.1 Location updating / accepted~~

### ~~9.4.1.1 Definition~~

### ~~9.4.1.2 Conformance requirement~~

~~1.~~

~~1.1 if the network accepts a location updating from the UE and reallocates a TMSI in the LOCATION UPDATING ACCEPT message the UE shall acknowledge the reception of the new TMSI;~~

~~1.2 the UE shall answer to paging with this TMSI and include it in a PAGING RESPONSE message.~~

~~2 If the network accepts a location updating from the UE and the LOCATION UPDATING ACCEPT message contains neither TMSI nor IMSI, the UE shall answer to paging when addressed with the last allocated TMSI and include it in the PAGING RESPONSE message.~~

~~3.~~

~~3.1 if the network accepts a location updating from the UE by use of a LOCATION UPDATING ACCEPT message containing the IMSI of the UE, the UE shall not answer paging with the last allocated TMSI;~~

~~3.2 the UE shall still answer paging with IMSI.~~

### Reference(s)

TS 24.008 clause 4.4.4.6.

### ~~9.4.1.3 Test purpose~~

~~1) To test the behaviour of the UE if the network accepts the location updating of the UE.~~

For the network response three different cases are identified:

~~1.1) TMSI is allocated;~~

~~1.2) location updating accept contains neither TMSI nor IMSI;~~

~~1.3) location updating accept contains IMSI.~~

### ~~9.4.1.4 Method of test~~

~~Initial conditions:~~

~~— System Simulator:~~

~~— two cells, A and B, belonging to different location areas with location area identification a and b of the same PLMN;~~

~~— IMSI attach/detach is allowed in both cells;~~

~~— the T3212 time-out value is 1/10 hour in both cells.~~

~~— User Equipment:~~

~~— the UE has a valid TMSI (=TMSI1) and CKSN (=CKSN1). It is "idle updated" on cell A.~~

Related ICS/IXIT statement(s)

None.

## Test Procedure

The UE is made to select cell B. A normal location updating with TMSI reallocation is performed in cell B. The RRC CONNECTION is released. The SS checks, by paging, that the UE has stored the newly allocated TMSI. The RRC CONNECTION is released. The UE is made to select cell A. A normal location updating is performed in cell A. The LOCATION UPDATING ACCEPT message contains neither IMSI nor TMSI. The SS checks, by paging, that the UE has kept the old TMSI. The RRC CONNECTION is released. The UE is made to select cell B. A normal location updating is performed in cell B. The LOCATION UPDATING ACCEPT message contains an IMSI. The SS checks, by paging, that the UE has deleted its TMSI and responds to paging with IMSI.

### Specific message contents

None.

### 9.4.1.5 Test requirement

At step 7 the UE shall acknowledge the reception of the new TMSI (TMSI2).

At step 11 the UE shall answer to paging with this TMSI (TMSI2).

At step 23 the UE shall answer to paging with the last allocated TMSI (TMSI2).

At step 35 the UE shall not answer paging with the last allocated TMSI, but at step 37 the UE shall still answer paging with IMSI.

## 9.4.2 Location updating / rejected

### 9.4.2.1 Location updating / rejected / IMSI invalid

#### 9.4.2.1.1 Definition

#### 9.4.2.1.2 Conformance requirement

- 1) If the network rejects a location updating from the UE with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the UE shall:
  - 1.1 not perform normal location updating;
  - 1.2 not perform periodic location updating;
  - 1.3 not respond to paging with IMSI;
  - 1.4 not respond to paging with TMSI;
  - 1.5 reject any request from CM entity for MM connection other than for emergency call;
  - 1.6 not perform IMSI detach if it is switched off or has its power source removed.
- 2) If the network rejects a location updating from the UE with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the UE, if it supports speech, shall accept a request for an emergency call by sending a RRC CONNECTION Request message with the establishment cause set to "emergency call" and include an IMEI as mobile identity in the CM SERVICE REQUEST message.
- 3) If the network rejects a location updating from the UE with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the UE shall delete the stored LAI, CKSN and TMSI.

#### Reference(s)

TS 24.008 clause 4.4.4.7.

#### 9.4.2.1.3 Test purpose

To test the behaviour of the UE if the network rejects the location updating of the UE with the cause "IMSI unknown in HLR", "illegal MS" or "Illegal ME".

#### 9.4.2.1.4 Method of test

##### Initial conditions

- System Simulator:
  - two cells: A and B, belonging to different location areas of the same PLMN;
  - IMSI attach/detach is allowed in both cells;
  - the T3212 time-out value is 1/10 hour in both cells.
- User Equipment:
  - the UE has valid TMSI, CKSN and CK, IK. It is "idle updated" on cell A.

##### Related ICS/IXIT statement(s)

USIM removal possible while the UE is powered Yes/No.

Switch off on button Yes/No.

Support for speech Yes/No.

### Test Procedure

The SS rejects a normal location updating with the cause value "IMSI unknown in HLR". The RRC CONNECTION is released. The SS checks that the UE has entered the state MM IDLE and the substate NO IMSI, i.e. does not perform normal location updating when a new cell of the same or another PLMN is entered, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if it is switched off or has its power source removed.

The test is repeated with cause value "Illegal MS" and with cause value "Illegal ME".

## Expected sequence

The sequence is executed for execution-counter  $k = 1, 2, 3$ .

#### Specific message contents

None.

#### 9.4.2.1.5 — Test requirement

- 1) 1.1 At step 10 the UE shall not perform normal location updating.
- 1.2 At step 12 the UE shall not perform periodic location updating.
- 1.3 At step 14 the UE shall not respond to paging with IMSI.
- 1.4 At step 16 the UE shall not respond to paging with TMSI.
- 1.5 At step 18 the UE shall reject a MO-CM connection.
- 1.6 At step 30 the UE shall not initiate an RRC connection establishment on cell A or on cell B.
- 2) At step 20 the UE shall accept a request for an emergency call with the establishment cause set to "Emergency call".
- 3) At step 35 the UE shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the LAI "deleted LAI".

#### 9.4.2.2 — Location updating / rejected / PLMN not allowed

##### 9.4.2.2.1 — Definition

##### 9.4.2.2.2 — Conformance requirement

- 1) If the network reject a location updating from the UE with the cause "PLMN not allowed" the UE shall:
  - 1.1 not perform periodic updating;
  - 1.2 not perform IMSI detach when switched off;

- ~~1.3 not perform IMSI attach when switched on in the same location area;~~
- ~~1.4 not perform normal location updating when in the same PLMN and when that PLMN is not selected manually;~~
- ~~1.5 reject any request from CM entity for MM connection other than for emergency call.~~
- ~~2) If the network rejects a location updating from the UE with the cause "PLMN not allowed" the UE shall:~~
  - ~~2.1 perform normal location updating when a new PLMN is entered;~~
  - ~~2.2 accept a request for an emergency call, if it supports speech, by sending a RRC CONNECTION REQUEST message with the establishment cause set to "emergency call".~~
- ~~3) If the network rejects a location updating from the UE with the cause "PLMN not allowed" and if after that the PLMN from which this rejection was received, is manually selected, the UE shall perform a normal location updating procedure.~~

#### Reference(s)

TS 24.008 clause 4.4.4.7.

#### ~~9.4.2.2.3 Test purpose~~

~~To test the behaviour of the UE if the network rejects the location updating of the UE with the cause "PLMN not allowed".~~

#### ~~9.4.2.2.4 Method of test~~

#### ~~9.4.2.2.4.1 Location updating / rejected / PLMN not allowed / test 1~~

#### Initial conditions

- ~~— System Simulator:~~
  - ~~— one cell: C, belonging to PLMN1;~~
  - ~~— two cells: A and B, belonging to different location areas a and b and belonging to PLMN2. PLMN2 is different from HPLMN and from PLMN1;~~
  - ~~— IMSI attach/detach is allowed in cells A and B but not in cell C;~~
  - ~~— the T3212 time-out value is 1/10 hour in cells A and B.~~
- ~~— User Equipment:~~
  - ~~— the UE has a valid TMSI. It is "idle-updated" on cell C;~~
  - ~~— the UE is in manual mode for PLMN selection.~~

#### Related ICS/IXIT statement(s)

~~USIM removal possible while the UE is powered Yes/No.~~

~~Switch-off on button Yes/No.~~

~~The UE is automatically in automatic mode after switch-on Yes/No.~~

~~Support for speech Yes/No.~~

#### Test Procedure

~~The SS rejects a normal location updating with the cause value "PLMN not allowed". The RRC CONNECTION is released. The SS checks that the UE does not perform periodic updating, does not perform IMSI detach, does not~~

perform IMSI attach if activated in the same location area, rejects any request for CM connection establishment other than emergency call, accepts a request for an emergency call and performs normal location updating only when a new PLMN is entered.

| NOTE: — The definitions for "Serving cell", "Suitable neighbor cell" and "non-suitable cell" are specified in TS 34.108 clause 6.1 "Reference Radio Conditions for signalling test cases only". |           |    |                                 |                                                                                                                                                                                                                                                                                       |

## Specific message contents:

None.

## 9.4.2.2.4.2 Location updating / rejected / PLMN not allowed / test 2

## Initial conditions

## — System Simulator:

- one cell C, belonging to PLMN1;
- two cells A and B, belonging to different location areas a and b and belonging to PLMN2. PLMN2 is different from HPLMN;
- IMSI attach/detach is allowed in cells A and B but not in cell C;
- the T3212 time-out value is 1/10 hour in cells A and B.

## — User Equipment:

- the UE has a valid TMSI. It is "idle-updated" on cell C.

## Related ICS/IXIT statement(s)

USIM removal possible while UE is powered Yes/No:

Switch off on button Yes/No:

The UE is automatically in automatic mode after switch on Yes/No:

### Test Procedure

The SS rejects a normal location updating with the cause value "PLMN not allowed". The RRC CONNECTION is released. Then the PLMN from which this rejection was received is manually selected and the SS checks that a normal location updating is performed.

## Expected sequence

### Specific message contents

None.

#### 9.4.2.2.5 ~~Test requirement~~

- 1) ~~1.1 At step 12 in test 1 the UE shall not perform periodic updating.~~
  - 1.2 ~~At step 14 in test 1 the UE shall not initiate an RRC connection establishment (IMSI detach).~~
  - 1.3 ~~At step 16 in test 1 the UE shall not initiate an RRC connection establishment (IMSI attach).~~
  - 1.4 ~~At step 16 in test 1 the UE shall not perform normal location updating.~~
  - 1.5 ~~At step 30 in test 1 the UE shall reject a MO CM connection.~~
- 2) ~~2.1 At step 37 in test 1 the UE shall perform normal location updating.~~
  - 2.2 ~~At step 20 in test 1 the UE shall accept a request for an emergency call with the establishment cause set to "Emergency call".~~
- 3) ~~At step 11 in test 2 the UE is made to search for PLMNs and the PLMN indicated by the SS is manually selected, and at step 15 the UE shall perform a normal location updating procedure.~~

#### 9.4.2.3 ~~Location updating / rejected / location area not allowed~~

##### 9.4.2.3.1 ~~Definition~~

##### 9.4.2.3.2 ~~Conformance requirement~~

- 1) ~~If the network rejects a location updating from the UE with the cause "Location Area not allowed" the UE shall:~~
  - 1.1 ~~not perform periodic updating;~~
  - 1.2 ~~not respond to paging with TMSI;~~
  - 1.3 ~~reject any request from CM entity for MM connection other than for emergency call;~~
  - 1.4 ~~not perform IMSI detach.~~
- 2) ~~If the network rejects a location updating from the UE with the cause "Location Area not allowed" the UE shall:~~
  - 2.1 ~~perform normal location updating when a new location area is entered;~~
  - 2.2 ~~accept a request for an emergency call, if it supports speech, by sending a RRC CONNECTION REQUEST message with the establishment cause set to "emergency call";~~
  - 2.3 ~~delete the list of forbidden LAs after switch off (power off).~~

### Reference(s)

TS 24.008 clause 4.4.4.7.

#### 9.4.2.3.3 ~~Test purpose~~

~~To test the behaviour of the UE if the network rejects the location updating of the UE with the cause "Location Area not allowed".~~

~~To test that the UE deletes the list of forbidden LAs after switch off (power off).~~

#### 9.4.2.3.4 ~~Method of test~~

##### ~~Initial conditions~~

- ~~— System Simulator:~~
  - ~~— two cells: A and B, belonging to different location areas a and b;~~
  - ~~— IMSI attach/detach is allowed in both cells;~~
  - ~~— the T3212 time-out value is 1/10 hour in both cells.~~
- ~~— User Equipment:~~
  - ~~— the UE has a valid TMSI. It is "idle updated" on cell A.~~

##### ~~Related ICS/IXIT statement(s)~~

~~Switch off on button Yes/No.~~

~~Support for speech Yes/No.~~

~~Method to clear the list of forbidden location areas periodically.~~

##### ~~Test Procedure~~

~~The SS rejects a normal location updating with the cause value "Location Area not allowed". The RRC CONNECTION is released. The SS checks that the UE does not perform periodic updating, does not respond to paging with TMSI, rejects any requests from CM entities for MM-connections except emergency calls, does not perform IMSI detach, performs normal location updating when a new location area is entered and deletes the list of forbidden LAs when switched off.~~

~~Different types of UE may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12am). If the list is cleared while the test is being run, it may be necessary to re-run the test.~~

### Specific message contents

None.

#### 9.4.2.3.5 Test requirement

- 1) 1.1 At step 10 the UE shall not perform periodic updating.
- 1.2 At step 12 the UE shall not respond to paging with TMSI.
- 1.3 At step 14 the UE shall not initiate an RRC connection establishment.
- 1.4 At step 26 the UE shall not initiate an RRC connection establishment (IMSI detach).
- 2) 2.1 At step 39 the UE shall perform normal location updating.
- 2.2 At step 16 the UE shall accept a request for an emergency call.
- 2.3 At step 31 the UE shall send a LOCATION UPDATING REQUEST message with the LAI "deleted LAI".

#### 9.4.2.4 Location updating / rejected / roaming not allowed in this location area

##### 9.4.2.4.1 Definition

##### 9.4.2.4.2 Conformance requirement

- 1) If the network rejects a location updating from the UE with the cause "Roaming not allowed in this location area" the UE shall:
  - 1.1 not perform periodic updating;
  - 1.2 not respond to paging with TMSI;
  - 1.3 reject any request from CM entity for MM connection other than for emergency call;
  - 1.4 not perform IMSI detach.
- 2) If the network rejects a location updating from the UE with the cause "Roaming not allowed in this location area" the UE shall:
  - 2.1 perform normal location updating when a new location area is entered;

2.2 accept a request for an emergency call, if it supports speech, by sending a RRC CONNECTION Request message with the establishment cause set to "emergency call";

2.3 periodically search for its HPLMN.

3) The UE shall reset the list of "Forbidden location areas for roaming" when it is switched off or has its power source removed or when the USIM is removed.

4) The UE shall contain a list of "forbidden location areas for roaming". The location area identification received on the BCCH that triggered the location updating request shall be added to the suitable list whenever a LOCATION UPDATE REJECT message is received with the cause "Roaming not allowed in this location area". The lists shall accommodate each 10 or more location area identifications.

#### Reference(s)

TS 24.008 clause 4.4.4.7.

#### 9.4.2.4.3 ————— Test purposes

##### Test purpose 1

To test that on receipt of a rejection using the Roaming cause code, the UE ceases trying to update on that cell, that this situation continues for at least one periodic location interval period, and that the corresponding list is re-set by switching off the UE or removing its power source.

##### Test purpose 2

To test that if no cell is available, the UE does not answer to paging with TMSI, rejects a request from CM entity other than for emergency calls.

##### Test purpose 3

To test that at least 6 entries can be held in the list of "forbidden location areas for roaming" (the requirement in is to store at least 10 entries. This is not fully tested by the third procedure).

##### Test purpose 4

To test that if a cell of the Home PLMN is available then the UE returns to it in preference to any other available cell.

##### Test purpose 5

To test that if the USIM is removed the list of "forbidden location areas for roaming" is cleared.

#### 9.4.2.4.4 ————— Method of test

#### Initial conditions

The initial conditions shall be met before each of the different procedures.

##### — System Simulator:

- for procedures 1, 2, 3 and 5: Two cells A and B, belonging to different location areas of the same PLMN with LAI a and b. The MCC of that PLMN is the same as that of the HPLMN. The MNC of that PLMN is different from that of the HPLMN;
- for procedure 4: three cells A, B, C of the same PLMN which is not the HPLMN with 3 different location area codes. Cells should differ in signal strength by 10 dB with cell A being the strongest and cell C the weakest. There should be a 20 dB range between A and C. A should be set to a level of -40 dBm;
- IMSI attach/detach is allowed in every cell;
- the T3212 time-out value is 1/10 hour in every cell.

— User Equipment:

- procedures 1, 2, 3 and 5: The UE has valid TMSI, CKSN and CK, IK. It is "idle updated" on cell B;
- procedure 4: The UE has valid TMSI, CKSN and CK, IK. It is "idle updated" on cell A;
- the list of "forbidden location areas for roaming" shall be empty (this may be achieved by either removing the USIM or switching the UE OFF then ON or removing the UE power source depending on ICS).

Related ICS/IXIT statement(s)

USIM removal possible while UE is powered Yes/No.

Switch-off on button Yes/No.

Support of speech Yes/No.

Method to clear the list of location areas for roaming periodically.

The UE is automatically in automatic mode after switch-on Yes/No.

Test Procedures

Procedure 1:

- The SS rejects a normal location updating with the cause value "Roaming not allowed in this location area". The RRC CONNECTION is released. The SS checks that the UE does not perform periodic location updating procedure. The UE is turned off and then on. The SS checks that the UE performs location updating on the cell on which its location update request had been rejected (this checks that the LA is not the forbidden list after switch on). This procedure is performed another time but the deletion of the list is checked while removing the USIM (instead of turning off the UE).

Procedure 2:

- The SS rejects a normal location updating with the cause value "Roaming not allowed in this location area". The RRC CONNECTION is released. The SS checks that the UE does not answer to a paging message with TMSI, rejects a request from CM entity but supports an emergency call.

Procedure 3:

- The SS rejects a normal location updating with the cause value "Roaming not allowed in this location area". This is done for 6 different location areas. Then the SS checks that the UE does not attempt to begin a location updating procedure on the non-allowed location areas.

Procedure 4:

- The SS accepts a periodic location updating on a cell not belonging to the HPLMN. Then when the UE attempts to perform a periodic location updating to this cell, the SS rejects this location updating with the cause value "Roaming not allowed in this location area". Two cells are then available, one belonging to the HPLMN but with the weakest level. It is checked that the UE returns to its HPLMN.

Procedure 5: If USIM removal is possible while UE is powered:

- The SS rejects a normal location updating with the cause value "Roaming not allowed in this location area". The RRC CONNECTION is released. The SS checks that the UE does not perform periodic location updating procedure. The USIM is removed and inserted in the UE. The SS checks that the UE performs location updating on the cell on which its location update request had been rejected (this checks that the LA is not the forbidden list after switch on).

Different types of UE may use different methods to periodically clear the list of forbidden areas (e.g. every day at 12am) for roaming. If the list is cleared while the test is being run, it may be necessary to re-run the test.

## Expected sequence

The following procedure is used during the test:

—change\_LAI(x):

—the purpose of this procedure is to change the value of Location Area Identifier of cell x;

—the Location Area Identifier of cell x shall be changed. The code shall be chosen arbitrarily but shall be different from any previously used in this procedure. The code shall have the same MCC as the Home PLMN and shall not have the same MNC as the Home PLMN.

## Procedure 1

| Step                                                                                                                                                                 | Direction |    | Message                         | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Specific message contents

None.

## 9.4.2.4.5 — Test requirement

- 1) 1.1 At step 10 in Procedure 1 the UE shall not perform periodic updating.
- 1.2 At step 19 in Procedure 2 the UE shall not respond to paging with TMSI.
- 1.3 At step 21 in procedure 2 the UE shall not initiate an RRC connection establishment.
- 1.4 After step 13 in Procedure 5 the UE shall perform location updating (at step 16; not perform IMSI detach).
- 2) 2.1 After step 9 in Procedure 2 the UE perform normal location updating (at step 12).
- 2.2 At step 23 in Procedure 2 the UE shall initiate a RRC CONNECTION REQUEST message with the establishment cause set to "Emergency call";
- 2.3 After step 14 in Procedure 4 the UE shall attempt to location updating with location updating type "periodic" (at step 21; periodically search for its HPLMN).
- 3) After step 12 in Procedure 5 the UE shall perform location updating (at step 16) when the USIM is removed.
- 4) At step 49 in Procedure 3 the UE shall not attempt to begin a location updating procedure.

### ~~9.4.2.5 Location updating / rejected / No Suitable Cells In Location Area~~

#### ~~9.4.2.5.1 Definition~~

#### ~~9.4.2.5.2 Conformance requirement~~

- ~~1) If the network rejects a location updating from the UE with the cause "No Suitable Cells In Location Area" the UE shall:~~
  - ~~1.1 perform normal location updating at a suitable cell in another location area in the same PLMN;~~
  - ~~1.2 delete the stored CKSN, LAI and TMSI.~~

#### Reference(s)

TS 24.008 clause 4.4.4.7.

#### ~~9.4.2.5.3 Test purpose~~

To test the behaviour of the UE if the network rejects the location updating of the UE with the cause "No Suitable Cells In Location Area".

#### ~~9.4.2.5.4 Method of test~~

#### Initial conditions

- ~~— System Simulator:~~
  - ~~— two cells: A and B, belonging to different location areas a and b and belonging to PLMN1;~~
  - ~~— one cell: C, belonging to PLMN2;~~
  - ~~— IMSI attach/detach is allowed in cells A, B and C;~~
- ~~— User Equipment:~~
  - ~~— the UE has a valid TMSI(= TMSI1) and CKSN(= CKSN1). It is "idle-updated" on cell A.~~

#### Related ICS/IXIT statement(s)

None.

#### Test Procedure

The SS rejects a normal location updating with the cause value "No Suitable Cells In Location Area". The RRC CONNECTION is released. The SS checks that the UE shall search for a suitable cell in a different location area on the same PLMN, and shall perform normal location updating procedure in that cell

## Specific message contents

None.

## 9.4.2.5.5 — Test requirement

At step 12 the UE shall perform normal location updating with CKSN IE set to "no key available", LAI IE set to "deleted LAI" and Mobile Identity IE set to its IMSI.

### 9.4.3 Location updating / abnormal cases

#### 9.4.3.1 Void

#### 9.4.3.2 Location updating / abnormal cases / attempt counter less or equal to 4, LAI different

##### 9.4.3.2.1 Definition

##### 9.4.3.2.2 Conformance requirement

- 1) When a failure such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 has occurred during a normal location updating procedure, if the attempt counter is smaller than 4 and after expiry of T3211, the UE shall resend its LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating Type IE set to "normal location updating".
- 2) When a failure such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 has occurred during a normal location updating procedure the UE shall:
  - 2.1 not answer to paging with the previously allocated TMSI;
  - 2.2 not perform the IMSI detach procedure, when switched off.
- 3) When a failure such as case e) of clause 4.4.4.9 of TS 24.008 has occurred during a normal location updating procedure and when an emergency call establishment is requested by the user the UE, if it supports speech, shall send a CM SERVICE REQUEST message with CM Service Type IE set to "emergency call establishment", CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI and after acceptance by the network it shall send an EMERGENCY SETUP message.
- 4) When a failure such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 has occurred during a normal location updating procedure the UE shall use a request from CM entity other than emergency call as a trigger for a normal location updating procedure and shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating Type IE set to "normal location updating".
- 5) When a failure such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 has occurred during a normal location updating procedure the UE shall answer to paging with IMSI and shall send a PAGING RESPONSE message with CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI.
- 6) When a failure such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 has occurred during a normal location updating procedure the UE shall perform a normal location updating procedure as soon as it enters a new cell.

#### References

TS 24.008 clauses 4.4.4.2, 4.4.4.9.

##### 9.4.3.2.3 Test purpose

To verify that the UE performs normal location updating procedures when its attempt counter is smaller than 4.

To check that the UE does not perform the IMSI detach procedure when "idle not updated".

To verify that when "idle not updated" the UE can perform an emergency call.

To verify that when "idle not updated" the UE uses requests from CM layer other than emergency call as triggering of a normal location updating procedure.

To verify that the UE performs a normal location updating procedure if it enters a new cell while being "idle not updated".

#### 9.4.3.2.4 ~~Method of test~~

##### ~~Initial conditions~~

- ~~— System Simulator:~~
  - ~~— two cells: A and B of the same PLMN, belonging to different location areas with LAI a and b;~~
  - ~~— ATT flag shall be set to IMSI attach/detach allowed.~~
- ~~— User Equipment:~~
  - ~~— the UE is "idle updated" on cell A. A valid CKSN value is stored in the USIM and is noted "initial CKSN". A TMSI is allocated.~~

##### ~~Related ICS/IXIT statements~~

~~USIM removal possible while UE is powered Yes/No.~~

~~Switch off on button Yes/No.~~

~~Support for speech Yes/No.~~

##### ~~Test Procedure~~

~~The UE is made to perform a normal location updating procedure. Five types of failure cases are triggered:~~

- ~~— sending of a Location Updating Reject with cause randomly chosen between all defined cause values except 2, 3, 6, 11, 12 and 13 (which trigger a different action) (case g of TS 24.008 clause 4.4.4.9);~~
- ~~— RRC connection failure (case d);~~
- ~~— sending of a RRC CONNECTION RELEASE message before the normal end of the procedure (case f);~~
- ~~— T3210 time-out (case e);~~
- ~~— RR connection establishment failure (case h).~~

~~As there is no stored LAI or the stored LAI is different from the broadcast LAI, and the attempt counter in the UE shall be lower than 4, the UE enters the state MM IDLE and substate ATTEMPTING TO UPDATE and waits for T3211 seconds before trying again a location updating procedure.~~

~~Then the behaviour of the UE in the MM IDLE state and ATTEMPTING TO UPDATE substate is checked, that is:~~

- ~~— not answer to paging with TMSI;~~
- ~~— not perform an IMSI detach procedure;~~
- ~~— support request for emergency call;~~
- ~~— use requests from CM layer other than emergency call as triggering of a normal location updating procedure;~~
- ~~— perform normal location updating procedure when a new cell is entered.~~

## Expected sequence

### Specific message contents

None.

#### 9.4.3.2.5 Test requirement

- 1) At step 13 the UE shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key available" and the Location Updating Type IE set to "normal location updating".
- 2)
  - 2.1 At step 40 the UE shall not answer to paging with the previously allocated TMSI.
  - 2.2 At step 43 the UE shall not perform the IMSI detach procedure.
- 3) At step 67 the UE shall send a CM SERVICE REQUEST message with CM Service Type IE set to "emergency call establishment", CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI.  
At step 69 the UE shall send an EMERGENCY SETUP message.
- 4) At step 93 the UE shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating Type IE set to "normal location updating".
- 5) At step 112 the UE shall send a PAGING RESPONSE message with CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI.
- 6) At step 110d the UE shall perform a normal location updating procedure.

#### 9.4.3.3 Location updating / abnormal cases / attempt counter equal to 4

##### 9.4.3.3.1 Definition

##### 9.4.3.3.2 Conformance requirement

- 1) When four failures such as cases d) to h) of clause 4.4.4.9 of TS 24.008 have occurred during a normal location updating procedure the UE shall:
  - 1.1 perform location updating after T3212 expiry by sending a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating Type set to "normal location updating";
  - 1.2 if the T3212 initiated location updating was unsuccessful, then after T3211 expiry the UE shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating Type IE set to "normal location updating".

- 2) When four failures such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 have occurred during a normal location-updating procedure the UE shall not perform the IMSI detach procedure, when switched off.
- 3) When four failures such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 have occurred during a normal location-updating procedure the UE, if it supports speech, shall be able to perform an emergency call i.e. the UE is able to send a CM SERVICE REQUEST message with the CM Service Type IE set to "emergency call establishment", CKSN IE set to "no key is available" and Mobile Identity IE set to its IMSI and then send an EMERGENCY SETUP message.
- 4) When four failures such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 have occurred during a normal location-updating procedure:
- 4.1 the UE shall use a request from CM entity for MM connection for a service other than emergency call as a trigger for a normal location updating procedure and shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating Type IE set to "normal location updating";
- 4.2 after a location updating triggered by a request from the CM layer which was unsuccessful, after T3211 expiry the UE shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating Type IE set to "normal location updating".
- 5) When four failures such as cases d), f), g) and h) of clause 4.4.4.9 of TS 24.008 have occurred during a normal location-updating procedure:
- 5.1 the UE shall perform a normal location-updating procedure if it enters a new cell;
- 5.2 if this location-updating is unsuccessful, after T3211 expiry the UE shall send a LOCATION UPDATING REQUEST message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".

## References

TS 24.008 clause 4.4.4.9.

### 9.4.3.3.3 ——— Test purpose

To verify that the UE performs normal location-updating procedures after T3212 expiry, when its attempt counter has reached value 4 and that the UE reset its attempt counter after a timer T3212 expiry.

To verify that the UE still follows the MM IDLE state and ATTEMPTING TO UPDATE substate requirements after its attempt counter has reached value 4.

To verify that the attempt counter is reset in the cases where it has to be done.

### 9.4.3.3.4 ——— Method of test

#### Initial conditions

— System Simulator:

- two cells: A and B, belonging to different location areas a and b;
- IMSI attach/detach is allowed in both cells;
- T3212 is set to 6 minutes.

— User Equipment:

- the UE is "Idle updated" on cell B with a valid CKSN and a TMSI.

#### Related ICS/IXIT statements

USIM removal possible while UE is powered Yes/No.

Switch-off on button Yes/No.

Support of speech Yes/No.

### Test Procedure

The UE is made to perform a normal location updating. The SS triggers a failure in this procedure by modifying scrambling code of DL-DPCH. After T3211 expiry the UE will try again the location updating procedure. The SS triggers again a failure by modifying it. This is done again 2 times. At this point the attempt counter shall be equal to 4. It is then checked that T3212 has been started and that at its expiry the UE will try a normal location updating procedure. It is verified that the UE has reset its attempt counter after timer T3212 expiry.

Then it is checked that, when the attempt counter has reached the value of 4, the UE is in the MM-IDLE state and ATTEMPTING-TO-UPDATE substate, that is:

- not perform an IMSI detach procedure;
- support request for emergency call;
- use requests from CM layer other than emergency call as triggering of a normal location updating procedure;
- perform normal location updating procedure when a new cell is entered.
